NORTH CENTRAL FOREST EXPERIMENT STATION
FOREST SERVICE
UNITED STATES DEPARTMENT OF AGRICULTURE

Land-Use Classes

Gross area.--The entire area of land and water as determined by the Bureau of Census, 1960.

Land area.--The area of dry land and land temporarily or partially covered by water such as marshes, swamps, flood plains, streams, sloughs, and estuaries. Canals less than 1/8-mile wide, and lakes, reservoirs, and ponds smaller than 40 acres are included as land area. These figures are from the Bureau of Census, 1960.

Forest land.--Land at least 16.7 percent stocked by forest trees of any size, or formerly having such tree cover, and not currently developed for nonforest use. Includes afforested areas. The minimum forest area classified was 1 acre. Roadside, streamside, and shelterbelt strips of timber must have a crown width of at least 120 feet to qualify as forest land. Unimproved roads and trails, streams, and clearings in forest areas were classed as forest if less than 120 feet in width.

Commercial forest land.--Forest land that is producing or is capable of producing crops of industrial wood and that is not withdrawn from timber utilization by statute or administrative regulation. This includes areas suitable for management to grow crops of industrial wood generally of a site quality capable of producing in excess of 20 cubic feet per acre of annual growth. This includes both inaccessible and inoperable areas.

Noncommercial forest land.--(a) Unproductive--forest land incapable of yielding crops of industrial wood because of adverse site conditions, (b) Productive--reserved--forest land withdrawn from commercial timber use through statute or administrative regulation, or exclusively used for Christmas tree production.

Nonforest land.--Land that has never supported forests, and land formerly forested where forest use is precluded by development for nonforest uses, such as cropland, improved pasture, residential areas, and city parks. Also includes improved roads and adjoining rights-of-way, powerline clearings, and certain areas of water classified by the Bureau

of Census as land. Unimproved roads, streams, canals, and nonforest strips in forest areas must be more than 120 feet wide, and clearings in forest areas must be more than 1 acre in size, to qualify as nonforest land.

Ownership Classes

National forest.--Federal lands that have been designated by executive order or statute as national forests or purchase units, and other lands under the administration of the USDA Forest Service.

Other Federal.--Federal lands other than national forest.

State, county, and municipal.--Lands owned by States, counties, or local public agencies, or lands leased by them for more than 50 years.

Forest industry.--Lands owned by companies or individuals operating primary wood-using plants.

Farmer-owned.--Lands owned by operators of farms. A farm must include 10 or more acres from which the sale of agricultural products totals \$50 or more annually, or if less than 10 acres, the yield must be at least \$250 annually.

Miscellaneous private.--Privately owned lands other than forest industry- or farmer-owned.

Tree Classes

All live trees.--Growing-stock, rough and rotten trees 1 inch d.b.h. and larger.

Growing-stock trees.--All live trees of commercial species except rough and rotten trees.

Desirable trees.--Growing-stock trees having no serious defects in quality limiting present or prospective use, and of relatively high vigor and containing no pathogens that may result in death or serious deterioration before rotation age. These are trees that would be favored by forest managers in silvicultural operations.

Acceptable trees.--Trees meeting the standards for growing stock but not qualifying as desirable trees.

Sawtimber trees.--Growing-stock trees of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs, each 8 feet or longer. At least 33 percent of the gross volume of the tree must be sound wood. Softwoods must be at least 9.0 inches d.b.h. and hardwoods at least 11.0 inches.

Poletimber trees.--Growing-stock trees of commercial species at least 5.0 inches d.b.h. but smaller than sawtimber size, and of good form and vigor.

Saplings.--Live trees of commercial species 1.0 to 5.0 inches d.b.h. and of good form and vigor.

Seedlings.--Live trees of commercial species less than 1.0 inch d.b.h. that are expected to survive according to regional standards. (Examples of seedlings not expected to survive are those that are diseased or heavily damaged by logging, browsing, or fire). Only softwood seedlings over 6 inches and hardwood seedlings over 1 foot in height are counted.

Rotten trees.--Live trees (any size) of commercial species that do not contain a merchantable 12-foot saw log or two noncontiguous 8-foot or longer saw logs, now or prospectively, because of rot (that is, when more than 50 percent of the cull volume of the tree is rotten).

Rough trees.--Live trees that do not contain at least one merchantable 12-foot saw log or two noncontiguous 8-foot or longer saw logs, now or prospectively, because of roughness and poor form, as well as all live noncommercial species.

Short-log (rough trees).--Sawtimber-sized trees of commercial species that contain at least one merchantable 8- to 11-foot saw log but not a 12-foot saw log.

Stocking

The degree of utilization of land by trees as measured in terms of basal area and/or the number of trees in a stand compared to the basal area and/or number

of trees required to utilize fully the growth potential of the land.

A stocking percent of 100 indicates full utilization of the site and is equivalent to 80 square feet of basal area per acre in trees 5 inches d.b.h. and larger. In a stand of trees less than 5 inches d.b.h., a stocking percent of 100 would indicate that the present number of trees is sufficient to produce 80 square feet of basal area per acre when the trees do reach 5 inches d.b.h.

Stocking of all live trees, growing-stock trees, and desirable trees are recorded separately and stands are grouped into the following stocking classes.

Stocking Classes

Overstocked stands.--Stands in which stocking of trees is 133 percent or more.

Fully stocked stands.--Stands in which stocking of trees is from 100 to 133 percent.

Medium-stocked stands.--Stands in which stocking of trees is from 60 to 100 percent.

Poorly stocked stands.--Stands in which stocking of trees is from 16.7 to 60 percent.

Nonstocked areas.--Commercial forest land on which stocking of trees is less than 16.7 percent.

Area-Condition Classes

Class 10.--Areas fully stocked with desirable trees but not overstocked.

Class 20.--Areas fully stocked with desirable trees, but overstocked with all live trees.

Class 30.--Areas medium to fully stocked with desirable trees, and with less than 30 percent of the area controlled by other trees and/or inhibiting vegetation or surface conditions that will prevent occupancy by desirable trees.

Class 40.--Areas medium to fully stocked with desirable trees and with 30 percent or more of the area controlled by other trees and/or conditions that ordinarily prevent occupancy by desirable trees.

Class 50.--Areas poorly stocked with desirable trees, but fully stocked with growing-stock trees.

Class 60.--Areas poorly stocked with desirable trees, but with medium to full stocking of growing-stock trees.

Class 70.--Areas poorly stocked with desirable trees, and poorly stocked with growing-stock trees.

Stand-Size Classes

Stand.--A growth of trees on a minimum of 1 acre of forest land that is stocked by forest trees of any size.

Sawtimber stands.--Stands at least 16.7 percent stocked with growing-stock trees, with half or more of this stocking in sawtimber or poletimber trees and with sawtimber stocking at least equal to poletimber stocking.

Poletimber stands.--Stands at least 16.7 percent stocked with growing-stock trees, and with half or more of this stocking in sawtimber and/or poletimber trees and with poletimber stocking exceeding that of sawtimber.

Sapling-seedling stands.--Stands at least 16.7 percent stocked with growing-stock trees and with saplings and/or seedlings comprising more than half of this stocking.

Nonstocked areas.--Commercial forest land on which stocking of growing-stock trees is less than 16.7 percent.

Other Classifications

Site index.--An expression of forest site quality based on the height of a free-growing dominant or codominant tree of a representative species in the forest type at age 50.

Site classes.--A classification of forest land in terms of inherent capacity to grow crops of industrial wood expressed in cubic-foot growth per acre per year.

Stand-age.--Age of the main stand. Main stand refers to trees of the dominant forest type and stand-size class.

Basal area.--The area in square feet of the cross section at breast height of a single tree. When the basal area of all the trees in a stand are summed, the result is usually expressed as square feet of basal area per acre.

Forest Types

A classification of forest land based upon the species forming a plurality of live-tree stocking. Major forest types in Missouri are:

Shortleaf pine.--Forests in which shortleaf pine comprises a plurality of the stocking. (Common associates include oak, hickory, and gum.)

Eastern redcedar.--Forests in which eastern redcedar comprises a plurality of the stocking. (Common associates include oak and hickory.)

Eastern redcedar-hardwood.--Forests in which hardwoods (usually upland oaks) comprise a plurality of the stocking but in which eastern redcedar comprises 25 to 50 percent of the stocking. (Common associates include gum, hickory, and yellow-poplar.)

Shortleaf pine-oak.--Forests in which upland oaks comprise a plurality of the stocking, but in which shortleaf pine comprises 25 to 50 percent of the stocking.

Post-blackjack oak.--Forests in which post oak or blackjack oak, singly or in combination, comprises a plurality of the stocking except where shortleaf pine or redcedar comprises 25 to 50 percent.

Black-scarlet oak.--Forests in which upland oaks or hickory, singly or in combination, comprises a plurality of the stocking except where shortleaf pine or redcedar comprises 25 to 50 percent, or where white oak or post and blackjack oak

comprise a plurality. (Common associates include yellow-poplar, elm, maple, and black walnut.)

White oak.--Forests in which white oak and other white oak species, singly or in combination, comprise a plurality of the stocking except where shortleaf pine or redcedar comprises 25 to 50 percent.

Oak-gum-cypress.--Bottomland forests in which bottomland oaks such as pin, swamp white, and shingle oaks, along with tupelo, blackgum, sweetgum, and cypress, singly or in combination, comprise a plurality of the stocking. (Common associates include cottonwood, willow, ash, elm, hackberry, and maple.)

Elm-ash-cottonwood.--Forests in which elm, ash, or cottonwood, singly or in combination, comprises a plurality of the stocking. (Common associates include willow, sycamore, beech, and maple.)

Cottonwood.--Forests in which cottonwood comprises a plurality of the stocking.

Maple-beech.--Forests in which hard maple or beech, singly or in combination, comprises a plurality of the stocking. (Common associates include elm and basswood.)

Timber Volume

Volume of growing stock.--The volume of sound wood in the bole of growing-stock trees 5.0 inches d.b.h. and over, from a 1-foot stump to a minimum of 4.0-inch top diameter outside bark, or to the point where the central stem breaks into limbs. Growing-stock volumes are shown in cubic feet and cords. Conversion from one unit of measure to another may be accomplished by a factor of 79 cubic feet per solid wood cord.

Volume of sawtimber.--Net volume of the saw log portion of live sawtimber trees in board feet, International 1/4-inch rule, from stump to a minimum 7 inches top diameter outside bark for softwoods and 9 inches for hardwoods.

Upper stem portion.--That part of the bole of sawtimber trees above the merchantable sawtimber top to a minimum top diameter

of 4.0 inches outside bark or to the point where the central stem breaks into limbs.

Growth and Mortality

Net annual growth of growing stock.--Net annual growth of growing stock is the change in volume of sound wood that occurred during 1971 in growing-stock trees that were 5.0 inches d.b.h. or larger at the beginning of the year,

plus

the volume of sound wood in growing-stock trees smaller than 5.0 inches d.b.h. at the beginning of the year that grew sufficiently during the year to be reclassified into the 5.0-inch-or-larger d.b.h. classes (ingrowth),

plus

the volume of sound wood in trees that had been classified either as rough or rotten trees at the beginning of the year but were reclassified during the year as growing-stock trees,

plus

the annual change in volume of sound wood that occurred during the year on growing-stock trees that died during the year,

plus

the annual change in volume of sound wood that occurred in growing-stock trees included among timber removals for the year (See glossary for timber removals from growing stock, p. 5),

plus

the annual change in volume of sound wood in trees that had been classified as growing stock at the beginning of the year but were reclassified during the year as rough or rotten trees. Only the volume change that occurred during the portion of the years the trees were classified as growing stock was included,

minus

the volume of sound wood in growing-stock trees that died from natural causes during the year, and

minus

the volume of sound wood in trees that had been classified as growing stock at the beginning of the year, but were reclassified during the year as rough or rotten trees.

Net annual growth of sawtimber.--

Net annual growth of sawtimber is the change in volume of sound wood that occurred during 1971 in trees that were sawtimber size at the beginning of the year,

plus

the volume of sound wood in growing-stock trees smaller than sawtimber size at the beginning of the year that grew sufficiently during the year to be reclassified as sawtimber trees (ingrowth),

plus

the volume of sound wood in trees that had been classified either as rough or rotten trees at the beginning of the year, but were reclassified during the year as sawtimber trees,

plus

the annual change in volume of sound wood that occurred during the year on sawtimber trees that died during the year,

plus

the annual change in volume of sound wood that occurred in sawtimber trees included among timber removals for the year (see glossary for timber removals from sawtimber, p. 5),

plus

the annual change in volume of sound wood in trees that had been classified as sawtimber trees at the beginning of the year, but were reclassified during the year as rough or rotten trees. Only the volume change that occurred during the portion of the year the trees were classified as sawtimber was included,

minus

the volume of sound wood in sawtimber trees that died from natural causes during the year, and

minus

the volume of sound wood in trees that had been classified as sawtimber trees at the beginning of the year, but were reclassified during the year as rough or rotten trees.

Mortality of growing stock.--

The volume of sound wood in growing-stock trees dying annually from natural causes. Natural causes include fire, insects, disease, animal damage, weather, and suppression.

Mortality of sawtimber.--

The net board-foot volume of sawtimber trees dying annually from natural causes.

Timber Removals

Timber removals from growing stock.--

The volume of sound wood in growing-stock trees removed annually for forest products (including roundwood products and logging residues) and for other removals (see glossary for volume of growing stock, p. 4). Roundwood products are logs, bolts, or other round sections cut and used from trees. Logging residues are the unused portions of cut trees plus unused trees killed by logging. Other removals are growing-stock trees removed but not utilized for products or trees left standing but "removed" from the commercial forest land classification by land use change--examples are removals from cultural operations such as timber stand improvement work, land clearing, and changes in land use.

Timber removals from sawtimber.--

The net board-foot volume of live sawtimber trees removed for forest products annually (including roundwood products and logging residues) and for other removals (see glossary for volume of sawtimber, p. 4).

Timber products output.--

All timber products cut from roundwood, and byproducts of wood manufacturing plants. Roundwood products include logs, bolts, or other round sections cut from growing-stock trees,

cull trees, salvable dead trees, trees on nonforest land, noncommercial species, sapling-size trees, and limbwood. Byproducts from primary manufacturing plants include slabs, edgings, trimmings, miscuts, sawdust, shavings, veneer cores and clippings, and screenings of pulpmills that are used as pulp chips or other products.

Plant byproducts.--Wood products, such as pulpwood chips, obtained incidental to production of other manufactured products.

Plant residues.--Wood materials from manufacturing plants not utilized for some product.

FOREWORD

Forest Survey is a continuing endeavor as mandated by the McSweeney-McNary Forest Research Act of 1928. Its objective is to inventory periodically the Nation's forest lands to determine their extent, condition, and volumes of timber, growth, and depletions. This kind of up-to-date information is essential to frame intelligent forest policies and programs. USDA Forest Service regional experiment stations are charged with the responsibility for conducting these inventories and publishing summary reports for individual States. The North Central Forest Experiment Station is responsible for Forest Survey work done in Michigan, Wisconsin, Minnesota, North Dakota, eastern South Dakota, Nebraska, Iowa, Illinois, Indiana, Missouri, and Kansas.

Fieldwork for the 1972 Missouri Forest Survey was started in January 1970 and was completed in May 1973. Reports on the two previous surveys of Missouri's timber resource are dated 1947 and 1959. These earlier reports provide a basis for comparison with the information in this report for those interested in trends that have developed over the past quarter century.

Similar Resource Bulletins reporting statistical highlights and detailed tables on the timber resource of the other Survey Units in Missouri (see cover) are in preparation. These will provide the basis for a comprehensive analysis of the timber resource of the entire State which will be published as a separate report.

A higher degree of accuracy of survey information was obtained during the 1972 survey than otherwise would have been feasible because of intensified field sampling made possible by extra funding provided the North Central Station by the State Legislature through the Missouri Department of Conservation. The Department also conducted a canvass of primary wood-using plants in the State, which was used to help in estimating the quantity of timber products harvested in Missouri.

Personnel from the National Forests in Missouri installed sample plots on national forest lands, which were used to inventory those lands. The USDA Agricultural Stabilization and Conservation Service and the State Historical Society of Missouri furnished aerial photos used in the survey.

N O T E

• References to information concerning growth, mortality, and removals are dated 1971, but information concerning forest area and timber inventory incorporates changes that occurred during calendar year 1971; therefore, they represent conditions as of January 1, 1972 and are dated 1972.

• Many of the terms used in this Resource Bulletin have specialized meanings, which are defined in "Glossary of Terms Used in Resource Bulletins Reporting Missouri's 1972 Timber Resource." Copies of this Glossary can be obtained from the North Central Forest Experiment Station.

TIMBER RESOURCE OF MISSOURI'S RIVERBORDER, 1972

John S. Spencer, Jr., and Arnold J. Ostrom

HIGHLIGHTS¹

Forest Area

Area of forest land declined slightly from 2,237 thousand acres in 1959 to 2,157 thousand acres in 1972.

Commercial forest area slipped from 2,188 thousand acres in 1959 to 2,109 thousand acres in 1972.

Franklin County contains the largest area of commercial forest (234 thousand acres), followed by Jefferson County (216 thousand acres) and Callaway County (175 thousand acres).

Farmers, private individuals, and corporations not directly engaged in timber processing own 97 percent of the commercial forest land.

The white oak type and black-scarlet oak type dominated the commercial forest in 1972 as they did in 1959. In 1972 the white oak type totaled 701 thousand acres as compared to 504 thousand acres in 1959. The black-scarlet oak type totaled 486 thousand acres in 1972 as compared to 568 thousand acres in 1959.

Sawtimber stands account for 40 percent of commercial forest lands, followed by poletimber stands (36 percent), sapling and seedling stands (21 percent), and nonstocked areas (3 percent).

Timber Volume

Volume of growing stock (1.3 billion cubic feet) did not change significantly between 1959 and 1972.

Total sawtimber volume (3.6 billion board feet) remained virtually the same between 1959 and 1972.

Collectively, the oaks account for two-thirds of the 1972 growing-stock volume.

Average volume per acre of growing stock is 632 cubic feet (8.0 cords) in 1972, compared to 612 cubic feet (7.7 cords) in 1959.

Farmers, private individuals, and corporations not directly engaged in timber processing own 96 percent of the growing-stock volume.

Volume in rough and rotten trees that are alive (nongrowing stock) is 449 million cubic feet, most of which is in rough trees.

Short-log trees account for 76 million cubic feet of the total volume in rough and rotten trees.

Stand Conditions

Net annual growth on growing-stock trees was 34.2 million cubic feet (433 thousand cords) in 1971.

The rate of growth on growing-stock trees was 2.6 percent of inventory volume.

Mortality of growing-stock trees in 1971 amounted to 2.4 million cubic feet (30 thousand cords), largely caused by disease.

Forty-four percent of the commercial forest includes stands younger than 50 years old.

Area of commercial forest land is divided almost evenly into 10-year age classes.

Fifty-two percent of the commercial forest area is capable of growing trees 50 feet and taller at age 50, but only 16 percent is capable of growing trees 70 feet and taller at age 50.

¹Published 1959 statistics have been adjusted to be comparable with 1972 data because of changed definitions and procedures used during the two surveys.

Fifty-five percent of the commercial forest is poorly stocked and 3 percent is nonstocked with growing-stock trees.

Timber Use

Timber removals from growing stock in 1971 amounted to 36 million cubic feet (450 thousand cords), compared to net annual growth on growing-stock trees of 34 million cubic feet (433 thousand cords). (See glossary for timber removals, page 5).

Fifty-six percent of the volume of removals from growing stock was classed as "other" removals; and therefore was not utilized (see glossary for timber removals, page 5).

The output of timber products in 1969 amounted to 23 million cubic feet; principally as saw logs (36 percent), fuelwood (24 percent), cooperage (15 percent), and pulpwood (11 percent).

Total volume of wood residues from primary plants in 1969 was 7 million cubic feet, of which 3 million cubic feet was not used.²

Managed Harvest³

For the years 1972 through 1981, annual managed harvest from growing stock on commercial forests is estimated to average 39 million cubic feet (494 thousand cords)--32 million cubic feet from harvest cuttings and 7 million cubic feet from thinnings.

During the same period, annual managed harvest from rough and rotten trees (nongrowing stock) is estimated to average 12 million cubic feet (155 thousand cords).

TABLES

Area:

1. Area of land by land class, 1959 and 1972.

2. Area of land and forest land, by county.

²Primary plants are those using logs and bolts or chips, shavings, etc., from logs and bolts.

³Managed harvest is defined in the appendix on page 72.

3. Area of commercial forest land for survey unit and for individual counties within unit, by forest type and stand-size class.

4. Area of commercial forest land, by county and ownership class.

5. Area of commercial forest land, by stand-volume and ownership class.

6. Area of commercial forest land, by area-condition and ownership class.

7. Area of commercial forest land, by site and ownership class.

8. Area of commercial forest land, by forest type and ownership class.

9. Area of commercial forest land, by forest type and stand-age class.

10. Area of commercial forest land, by forest type and site-index class.

11. Area of commercial forest land, by forest type and basal-area class.

12. Area of commercial forest land, by forest type, stand-size, and site class.

13. Area of commercial forest land, by stocking class based on selected stand components.

14. Area of commercial forest land, by stocking class of growing-stock trees and stand-size class.

15. Area of noncommercial forest land, by ownership class.

16. Area of noncommercial forest land, by forest type.

Number of Trees:

17. Number of all live trees on commercial forest land, by species and diameter class.

18. Number of growing-stock trees on commercial forest land, by species and diameter class.

19. Number of short-log trees on commercial forest land, by species and diameter class.

Volume:

20. Net volume of growing stock and sawtimber on commercial forest land, by species, 1959 and 1972.

21. Net volume on commercial forest land for survey unit and for individual counties within unit, by species and kind of material.

22. Net volume of timber on commercial forest land, by class of timber, and softwoods and hardwoods.

23. Net volume of growing stock, sawtimber, and rough and rotten trees on commercial forest land, by individual species.

24. Net volume of growing stock and sawtimber on commercial forest land, by ownership class and species group.

25. Net volume of growing stock on commercial forest land, by species and diameter class.

26. Net volume of sawtimber on commercial forest land, by species and diameter class.

27. Net volume of growing stock on commercial forest land, by species and forest type.

28. Net volume of sawtimber on commercial forest land, by species and forest type.

29. Net volume of timber in cull trees on commercial forest land, by species and cull tree class.

30. Net volume of short-log trees on commercial forest land, by species and diameter class.

31. Net volume of sawtimber on commercial forest land, by species and log grade class.

32. Walnut volume on nonforest land, by diameter class and class of timber.

Growth and Removals:

33. Net annual growth of growing stock and sawtimber on commercial forest land, by species and county.

34. Timber removals from growing stock and sawtimber on commercial forest land, by item and species group.

35. Timber removals from growing stock and sawtimber on commercial forest land, by species and county.

Mortality:

36. Annual mortality of growing stock and sawtimber on commercial forest land, by cause and softwoods and hardwoods.

37. Annual mortality of growing stock and sawtimber on commercial forest land, by species.

Utilization:

38. Output of timber products by source of material and softwoods and hardwoods.

39. Forest products harvested, by ownership class and product.

40. Volume of primary plant residue, by kind of material and type of use.

41. Timber products output from roundwood, by species and product.

Annual Managed Harvest:

42. Average annual managed harvest for 1972-1981 from harvest cuttings and thinnings on commercial forest land, by species and kind of material.

43. Average annual managed harvest of growing stock for 1972-1981 from harvest cuttings and thinnings on commercial forest land, by species and forest type.

44. Average annual managed harvest of growing stock for 1972-1981 from harvest cuttings and thinnings on commercial forest land, by species and stand-volume class.

45. Average annual managed harvest for 1972-1981, by harvest cuttings of growing stock on commercial forest land, by species and stand-volume class.

46. Average annual managed harvest for 1972-1981, by thinnings of growing stock on commercial forest land, by species and stand-volume class.

47. Average annual managed harvest of sawtimber for 1972-1981 from harvest cuttings and thinnings on commercial forest land, by species and forest type.

48. Average annual managed harvest of sawtimber for 1972-1981 from harvest cuttings and thinnings on commercial forest land, by species and stand-volume class.

49. Average annual managed harvest for 1972-1981, by harvest cuttings of sawtimber on commercial forest land, by species and stand-volume class.

50. Average annual managed harvest for 1972-1981, by thinnings of sawtimber

on commercial forest land, by species and stand-volume class.

51. Area of managed harvest for 1972-1981, by harvest cuttings on commercial forest land, by forest type and stand-age class.

52. Area of managed harvest by thinnings on commercial forest land for 1972-1981, by forest type and stand-age class.

Text Tables:

53. Sampling errors for estimates smaller than unit totals of volume, net growth, and removals, and of area of commercial forest land.

54. Forest type, site index, and rotation age by management objective used in calculation of annual managed harvest, Missouri.

Table 1.--Area of land by land class, Riverborder, Missouri, 1959 and 1972
(Thousand acres)

LAND CLASS	1959 ^{1/}	1972

/ FOR A 10-YEAR PERIOD

1/ FOR A 10-YEAR PERIOD

PRINCIPAL TREE SPECIES IN MISSOURI'S RIVERBORDER UNIT⁴

SOFTWOOD SPECIES

Shortleaf pine *Pinus echinata*
 Baldcypress . *Taxodium distichum* var. *distichum*
 Eastern redcedar *Juniperus virginiana*

HARD HARDWOOD SPECIES

Ashes:

White ash *Fraxinus americana*
 Green ash *Fraxinus pennsylvanica*
 Blue ash *Fraxinus quadrangulata*

American beech *Fagus grandifolia*
 Black walnut *Juglans nigra*

Hard maples:

Black maple *Acer nigrum*
 Sugar maple *Acer saccharum*

Hickory group A:

Pecan *Carya illinoensis*
 Shellbark hickory *Carya laciniosa*
 Shagbark hickory *Carya ovata*
 Mockernut hickory *Carya tomentosa*

Hickory group B:

Bitternut hickory *Carya cordiformis*
 Pignut hickory . . . *Carya glabra* var. *glabra*
 Black hickory *Carya texana*

River birch *Betula nigra*

Select white oaks:

White oak *Quercus alba*
 Bur oak *Quercus macrocarpa*
 Swamp chestnut oak *Quercus michauxii*
 Chinkapin oak *Quercus muehlenbergii*

White oaks:

Swamp white oak *Quercus bicolor*
 Overcup oak *Quercus lyrata*

Other white oaks:

Post oak . . . *Quercus stellata* var. *stellata*

Select red oaks:

Cherrybark oak *Quercus falcata* var. *pagodaefolia*
 Northern red oak *Quercus rubra*
 Shumard oak . *Quercus shumardii* var. *shumardii*

Red oaks:

Scarlet oak *Quercus coccinea*

Southern red oak . *Quercus falcata* var. *falcata*
 Black oak *Quercus velutina*

Other red oaks:

Shingle oak *Quercus imbricaria*
 Blackjack oak *Quercus marilandica*
 Pin oak *Quercus palustris*
 Willow oak *Quercus phellos*

Other hard hardwoods:

Black locust *Robinia pseudoacacia*
 Common persimmon *Diospyros virginiana*
 Flowering dogwood *Cornus florida*
 Honeylocust *Gleditsia triacanthos*
 Red mulberry *Morus rubra*
 Sugarberry *Celtis laevigata*

SOFT HARDWOOD SPECIES

American basswood *Tilia americana*
 American sycamore *Platanus occidentalis*
 Black cherry *Prunus serotina*
 Butternut *Juglans cinerea*

Cottonwoods:

Eastern cottonwood *Populus deltoides*

Elms:

Winged elm *Ulmus alata*
 American elm *Ulmus americana*
 Slippery elm *Ulmus rubra*
 Rock elm *Ulmus thomasi*

Soft maples:

Red maple *Acer rubrum* var. *rubrum*
 Silver maple *Acer saccharinum*

Sweetgum *Liquidambar styraciflua*

Tupelo and blackgum:

Blackgum *Nyssa sylvatica* var. *biflora*
 Black tupelo . *Nyssa sylvatica* var. *sylvatica*
 Water tupelo *Nyssa aquatica*

Yellow-poplar *Liriodendron tulipifera*

Other soft hardwoods:

Black willow *Salix nigra*
 Boxelder *Acer negundo*
 Hackberry *Celtis occidentalis*
 Kentucky coffeetree . . . *Gymnocladus dioica*
 Northern catalpa *Catalpa speciosa*
 Ohio buckeye *Aesculus glabra*
 Sassafras *Sassafras albidum*

⁴The common and scientific names are based on "Check List of Native and Naturalized Trees of the United States (In-

cluding Alaska)," by Elbert L. Little, Jr., U.S. Dep. Agric., Agric. Handb. 41, 472 p. 1953.

APPENDIX

ACCURACY OF SURVEY

Forest survey information is based on a sampling procedure designed to provide reliable statistics at the State and Survey Unit levels. Consequently, the reported figures are estimates only. However, a measure of reliability of these figures is given by sampling errors. These sampling errors may be interpreted as meaning that the chances are two out of three that the results for the sample differ by no more than the amount indicated, from the results that would have been obtained if all trees in the Unit had been measured (a 100-percent inventory), using the same tree measurements.

For example, the estimated area of commercial forest land in the Riverborder Unit in 1972, 2,108.9 thousand acres, has a sampling error of ± 1.9 percent (± 40.1 thousand acres). The chances are two out of three, then, that the commercial forest area falls between 2,068.8 and 2,149.0 thousand acres ($2,108.9 \pm 40.1$), the limits within which the results of a 100-percent inventory would occur.

Following are sampling errors for total estimated volume, net growth, and removals for both growing stock and sawtimber, and for area of commercial forest land during the 1972 Riverborder Survey:

Item	Riverborder Unit totals	Sampling error (Percent)
Growing stock:		
Volume	16,883.9 M cords	3.5
Growth	432.6 M cords	4.4
Removals	450.1 M cords	10.0
Sawtimber:		
Volume	3,641.1 MM bd. ft.	5.0
Growth	85.2 MM bd. ft.	6.0
Removals	115.4 MM bd. ft.	8.1
Commercial forest land	2,108.9 M acres	1.9

As survey data are broken down into units smaller than State or Survey Unit totals, the sampling error increases. The smaller the breakdown, the larger the sampling error. For example, the sampling error for area of commercial forest land in a particular county is higher than that for total commercial forest area in the Survey Unit. An approximation of the increasing sampling error can be obtained from table 53, which shows the sampling errors associated with estimates smaller than totals in the Riverborder Unit.

Table 53.--Sampling errors^{1/} for estimates smaller than unit totals of volume, net growth, and removals, and of area of commercial forest land, Riverborder, Missouri, 1972

SAMPLING ERROR (PERCENT)	COMMERCIAL FOREST	GROWING STOCK			SAWTIMBER		
		INVENTORY	GROWTH	REMOVALS	INVENTORY	GROWTH	REMOVALS
	THOUSAND ACRES	THOUSAND CORDS			MILLION BOARD FEET ^{2/}

^{2/} INTERNATIONAL 1/4-INCH RULE.

SURVEY PROCEDURE

The major steps in the survey of the Riverborder Unit were as follows:

1. A total of 38,778 1-acre points distributed systematically across aerial photos of the entire area were observed. These points were classified as either forest land (11,042) or nonforest land (27,736) in order to make a preliminary estimate of forest area. Next, 4,292 of the forest points were stereoclassified as to forest type, stand-size class, and density. Then 590 points classed as forest and 1,903 points classed as nonforest were examined on the ground to correct the preliminary area estimate for errors in classification and for actual changes in land use since the photos were taken. Some of the points examined were locations of permanent sample plots (each of which contained one variable-radius plot with basal area factor five) established during the 1959 survey. Of the 483 points determined to be on commercial forest land from ground examination, 206 were at previously unsampled locations and 10-point variable-radius plots (basal area factor 37.5) were established uniformly over the sample acres. The remaining 277 points were at formerly established permanent plot locations and were re-measured by superimposing 10-point variable-radius plots (basal area factor 37.5) over the existing plot in addition to remeasuring the basal area factor five plot. Tree measurements made on new and remeasured plots were the basis for estimates of timber volume, growth, mortality, number of trees, and other forest classifications.

2. Statistics on timber utilization in 1969 were obtained from mill surveys and from remeasurement of permanent sample plots. The Missouri Department of Conservation conducted a canvass of resident sawmills, veneer mills, and other primary wood-using plants. The North Central Forest Experiment Station canvassed resident pulp mills, and the underground mining industry in Missouri, as well as out-of-State sawmills, pulp mills, and veneer mills to determine their use of timber from Missouri. Fuelwood and fencepost output was based on U.S. Census of Agriculture and Housing figures, a canvass of public and industrial timber owners, and a canvass

of resident wood-treating plants. Estimates of primary mill residue used for fuelwood were obtained from the canvass of primary wood-using plants in Missouri. Timber cut for products by owner class was determined by a canvass of all public and industrial timber owners. The portion of timber cut unaccounted for by the latter owners was grouped under "farmer and other owners."

3. To develop wood utilization factors used in converting timber products output to timber removals for saw logs, veneer logs, cooperage logs, pulpwood, and charcoal wood, 486 felled trees throughout the State were measured. Factors for all other products were obtained during the 1959-1960 Missouri utilization study.

4. Field data were sent to St. Paul where they were edited, punched on cards, and stored on magnetic tape for later machine sorting, computing, and tabulation.

MANAGED HARVEST

Managed harvest is the estimated volume of timber on commercial forest land that could be cut annually for the next 10 years, while improving tree stocking and bringing about a more even distribution of age classes. In Missouri, annual managed harvest is shown separately as that from harvest cutting and from thinnings, and was determined by computer using an area control system for determining the number of acres to be cut annually.

The harvest cut of sawtimber was calculated from stands of forest types normally managed for sawtimber whose site index and age indicated they were ready for harvest, or would be within the next 10 years. Table 54 shows the site index used in these calculations for each forest type to determine whether the objective of management would be to grow sawtimber or pulpwood. Included also is the rotation age for each.

Stands that did not qualify for harvest during that period were checked to see if they were overstocked by basal area standards, or would be within the next 10 years. Stands determined to be overstocked were "thinned" by the computer

Table 54.--Forest type, site index, and rotation age, by management objective, used in calculation of annual managed harvest, Missouri, 1972

Forest type	Site index	Rotation age: Years	Management objective
Shortleaf pine	50 or higher	60	Sawtimber
	Less than 50	40	Pulpwood
Shortleaf pine-oak	60 or higher	80	Sawtimber
	Less than 60	50	Pulpwood
Eastern redcedar	35 or higher	55	Sawtimber
	Less than 35	70	Sawtimber
Eastern recedar-hardwood	45 or higher	50	Sawtimber
	Less than 45	60	Sawtimber
Black-scarlet oak	60 or higher	80	Sawtimber
	Less than 60	50	Pulpwood
White oak	60 or higher	80	Sawtimber
	Less than 60	50	Pulpwood
Post-blackjack oak	All sites	50	Pulpwood
Oak-gum-cypress	All sites	60	Sawtimber
Cottonwood	All sites	30	Sawtimber
Elm-ash-cottonwood	All sites	50	Sawtimber
Maple-beech	All sites	90	Sawtimber

back to their recommended basal-area stocking level, and the volume of sawtimber trees "thinned" was added to the volume of managed harvest by thinnings of growing stock and sawtimber. The volume of poletimber trees "thinned" was added to the growing-stock managed harvest by thinnings. In scheduling thinnings, the computer program first "removes" rough and rotten trees, then short-log trees, and finally, growing-stock trees. The volume of managed harvest from rough, rotten, and short-log (rough) trees is kept separate from that from growing-stock trees.

The harvest cut of growing stock included that of sawtimber in addition to the volume from stands of forest types normally managed for pulpwood that were or would be rotation age within the next 10 years.

Managed harvest is based on the assumptions that all timber will be available and accessible when needed, and that a ready market will exist for every species, size, and grade of material harvested. Further, it assumes that the proper sequence of cutting is known and will be followed, and that logging practices employed will result

in an improved forest. Because there is no way of guaranteeing that these assumptions will be carried out during the next 10 years, the managed harvest estimates should be compared with timber removals figures only in a general way.

LOG GRADE

The butt log of every sawtimber tree (2,164 trees) on every permanent sample plot in the Riverborder Unit and all of the logs in a smaller sample of trees throughout the State (265 trees) were log-graded. The volume yield by log grade for each tree in the smaller sample was used to distribute the volume of trees in the permanent plot sample into log-grade classes. The resulting volumes were expanded to provide an estimate for the entire Unit.

Logs are graded on the basis of external characteristics as indicators of quality. Hardwood species were graded according to "Hardwood Log Grades for Standard Lumber and How to Use Them" published by the Forest Products Laboratory under the designation D1737A, 1961, and USDA Forest Service standards for hardwood tie and timber logs. The best 12-foot section of the lowest 16-foot hardwood log, or the best 12-foot

upper section if the butt log did not meet minimum log grade standards, was graded.

Shortleaf pine was graded according to "Interim Southern Pine Log Grades," USDA Forest Service, 1953. All other

softwoods were graded according to "Specifications for Log Grades of Hardwoods and Softwoods," Northern Hemlock and Hardwood Association, 1947. The lowest 16-foot log in softwood trees or a shorter log down to 12 feet if a 16-foot butt log was not present, was graded.
