North Central Forest Experiment Station
John H. Ohman, Director
Forest Service - U.S. Department of Agriculture
Folwell Avenue
St. Paul, Minnesota 55108

The cooperation of pulpmills using North Central States timber in 1973 is gratefully acknowledged. Thanks are also due the Michigan Department of Natural Resources for collecting data on the Michigan pulpmills.

THE AUTHORS

James E. Blyth, Principal Market Analyst, received his Bachelor's degree in forestry from Iowa State University in 1954, served 3 years in the Air Force as a Procurement Officer, and received his Master's degree in forest economics from Iowa State in 1960. He joined the Lake States Forest Experiment Station in St. Paul, Minnesota, in 1960 and worked on timber removals research in Forest Survey. In 1962 he transferred to the Duluth field office and did forest products marketing research in the Lake States for 4 years. In 1966, he returned to the St. Paul Office of the North Central Forest Experiment Station. He is now in charge of the timber products and removals

phase of the Forest Resources Evaluation Work Unit. He has authored more than 40 papers on forest industries, forest products marketing, and timber removals in the North Central Region.

Jerold T. Hahn is a Mensurationist for the Forest Evaluation Research Project at the Station. A graduate of the University of Illinois, Hahn holds both a Bachelor of Science and Master of Science in Forestry. Jerold spent his first 2 years with the North Central Station on a Forest Survey field crew and the last 8 as a mensuration and data-compilation expert specializing in computer analysis. He has authored several publications on volume and growth estimates, resource inventories, and forest products output.

HIGHLIGHTS

Lake States

Lake States pulpwood production surged to 5.5 million cords in 1974, the third consecutive year that production increased. Harvesting of all species groups, except spruce, increased. Output was an all-time high in each state-- 2.05 million cords in Wisconsin, 1.84 million cords in Michigan, and 1.58 million cords in Minnesota. Most of the additional wood cut above the 1973 level was used to increase woodyard inventories and supply new pulping capacity. Pulpmill capacity in 1974 was about 200 tons per day more than in 1973.

From 1965 to 1974 Lake States pulpwood production did not keep pace with the national trend.

For many years aspen has been the dominant pulpwood species, but its position is slipping. Softwood residue is becoming important in the pulpwood mix.

In 1967, Wisconsin overtook Michigan and became the leading pulpwood producer because its forests increased their share of the wood supplied to the large local pulp industry.

Central States

Pulpwood production hit a peak of 486,000 cords in 1974, the sixth record output in the last 7 years. Production rose because mills outside the area purchased more Central States wood. Hardwood residue, successfully substituted for roundwood, accounted for 58 percent of the pulpwood output. Missouri out-produced Illinois for the first time. If the average annual rate of growth in production in each State continues at the rate of the last decade, Missouri will be the top producer in 1976.

Pulping capacity fell to 1,415 tons per day. One large Illinois pulpmill is phasing out wood use in favor of wastepaper.

Correction sheet for RB-NC-29.

"PULPWOOD PRODUCTION IN THE NORTH CENTRAL REGION BY COUNTY, 1974"

By James E. Blyth and Jerold T. Hahn

Figure 1.--Cords of pulpwood bolts and logs harvested per 1,000 cords of merchantable volume in principal pulpwood species by Forest Survey Unit, 1974. (The heavy lines delineate the boundaries of the Forest Survey Units in each State.)

Figure 2.--Cords of pulpwood out per 1,000 acres of stocked commercial forest land in principal pulpwood-producing counties, 1974. Acres of stocked commercial forest land were determined during the last forest survey in each State.

Corrected title for Table 11, page 20.

Table 11.--Lake States pulpwood production by county and species, 1974

(In standard cords, roughwood basis)

PULPWOOD PRODUCTION IN THE NORTH CENTRAL REGION, BY COUNTY, 1974

James E. Blyth and Jerold T. Hahn

This is the 16th annual report on the pulpwood harvest in Lake States counties and the 15th annual report on the Central States harvest. Pulpwood constitutes more than half of the timber products harvested annually in the Lake States (Michigan, Minnesota, and Wisconsin), and it is an important product in the Central States (Illinois, Indiana, Iowa, and Missouri).

Current detailed pulpwood production¹/ information is necessary for intelligent planning and decision-making in wood procurement, forest resource management, and forest industry development. Also, researchers need current pulpwood information for planning projects.

Pulpmills using North Central States timber in 1974 reported their pulpwood receipts by species groups and counties of origin. This report presents the results of the survey, analyzes the data where appropriate, compares results with 1973 or earlier years, and discusses trends in pulpwood production and use.

The Lake States and Central States are discussed separately because the timber types in each area are different and less information can be released about the Central States (more detailed data on pulpwood production and receipts in the Central States would reveal the operations of individual mills).

To provide more detailed species information for the Lake States than in

earlier reports, the pine group is now divided into jack, red, and white; birch is shown as white and yellow; and the "miscellaneous hardwood" group formerly reported is now presented as 12 separate species groups.

Minnesota Forest Survey Units differ from those formerly reported to conform to those being used in the fourth survey of Minnesota's forest resource. Appendix table 9 shows the new Unit names and counties with- in each Unit where pulpwood was harvested in 1974.

LAKE STATES Production

Lake States pulpwood production climbed to 5.5 million cords in 1974, up 16 percent from 1973. This was the third consecutive year of record production. About half of the three-quarter million cord increase was used to build woodyard inventories. Additional pulping capacity in the Lake States absorbed a significant portion of the remainder.

Lake States mills consumed 99 percent of the pulpwood (table 1). Ninety-one percent was roundwood (including chips from roundwood); the remainder was residue from local wood-using plants.²/ Most of the residue (85 percent) was hardwood. Use of Lake States residue as pulpwood increased four-fold during the last decade.

¹ Pulpwood production is defined as the annual pulpwood volume from timber land in a specified area that was received at all mills, whereas pulpwood receipts are defined as the volume of wood received by mills in a specified area regardless of the geographic source.

² Residue is the byproduct from sawmills, veneer mills, cooperage mills, and other wood-using plants that is used for pulping. Residue includes slabs, edgings, veneer cores, sawdust, wood flour, and chips manufactured from these byproducts.

1/ VERTICAL COLUMNS OF FIGURES UNDER BOX HEADING -PRODUCTION BY STATES- PRESENT THE AMOUNT OF PULPWOOD CUT IN EACH STATE.

2/ MOSTLY WESTERN STATES.

3/ PULPWOOD SHIPPED TO MILLS OUTSIDE OF REGION.

4/ PONDEROSA PINE.

Pulpwood cutting from all species groups; except spruce, increased. Major gains were in aspen (271,000 cords) and pine (149,000 cords). Aspen harvesting rose more than 100,000 cords from the previous peak of 1966 while pine harvesting spurred more than 67,000 cords above its 1966 peak. Harvests of birch, tamarack, and miscellaneous hardwoods^{3/} advanced to record levels also.

Because this is the first report with detailed species information on pine, birch, and miscellaneous hardwoods, these groups are discussed below.

More than three-fourths (77 percent) of the pine cut was jack pine. Four-fifths of the birch harvest was white birch (table 2). Hard maple, red oak, soft

Table 2.--Lake States roundwood pulpwood production from pine and birch by State, 1974

(In thousand cords)

Species :	Production

TOTAL	84	44	101	230

* Less than 500 cords.

maple, and elm constituted 78 percent of the miscellaneous hardwoods production (table 3).

Wisconsin--The 2.05 million cord output was 294,000 cords higher than in 1973. Miscellaneous hardwoods (primarily maple and red oak) and pine led the advance, but cutting of all principal species increased. Although production rose in all parts of the State, the greatest gain was in central Wisconsin. Oneida, Price, and Lincoln counties led all others.

Michigan--Producers boosted their output sharply (16 percent) to 1.84 million cords. The largest gains were in aspen (103,000 cords), pine (55,000 cords), and miscellaneous hardwoods (59,000 cords). Output climbed more (129,000 cords) in the western Upper Peninsula than elsewhere. Top-producing counties were Marquette, Iron, and Dickinson.

Minnesota--Production increased to 1.58 million cords with the largest gain in aspen (131,000 cords). Demand for Minnesota pulpwood has expanded for three consecutive years. Northeastern Minnesota supplies more than half (58 percent) of the States pulpwood production. Top-producing counties were St. Louis, Koochiching, and Itasca.

The distribution of the harvest is shown in two ways: first, the amount of pulpwood cut relative to the merchantable

Table 3.--Lake States roundwood pulpwood production from miscellaneous hardwoods by species and State, 1974

* Less than 500 cords.

³ Miscellaneous hardwoods are all hardwoods except birch and aspen.

volume in major pulpwood species (fig. 1); and second, the amount of pulpwood cut relative to commercial forest area (fig. 2). Heaviest cutting pressure (per 1,000 cords of merchantable volume in principal pulpwood species) was in central Wisconsin and western Upper Michigan.

Receipts

Forty-one Lake States pulp mills received 5.85 million cords of pulpwood in 1974. Eight more mills used birch and four more used residue chips than in 1973 (table 4).

Receipts of spruce fell, but increased for other major species. For the fourth

successive year, the proportion of hardwood procured increased. Two-thirds of the receipts was hardwood compared with 58 percent a decade earlier. Demand for softwood residue dropped slightly after rising each of the previous 5 years.

Canada furnished 31 percent of the imported wood. Softwood imports from Canada in 1974 slipped to the lowest recorded level. Deliveries of Canadian softwood roundwood continued the irregular long term downtrend established in 1952, but were partially offset by greater receipts of Canadian softwood residues. In 1969, the first Canadian softwood residue entered the Lake States for pulping and Canada now appears to be an established source.

Figure 1.--Cords of pulpwood belts and logs harvested per 1,000 cords of merchantable volume in principal pulpwood species by Forest Survey Unit, 1974. (The heavy lines delineate the boundaries of the Forest Survey Units in each State.)

Figure 2.--Cords of pulpwood cut per 1,000 acres of stocked commercial forest land in principal pulpwood-producing counties, 1974. Acres of stocked commercial forest land were determined during the last forest survey in each State.

Slabwood and other residue	6	1	3	2
Total Plants ^{1/}	41	9	24	8

^{1/} Some plants use more than one species, so numbers in columns cannot be added.

Western States supplied all but 4 percent of the imports from other parts of the United States. Wyoming and South Dakota each provided more than 70,000 cords, primarily as softwood chips.

Wisconsin--Wood deliveries surged ahead 438,000 cords, despite a large drop in spruce requirements. Pine and hardwood roundwood markets were excellent.

Minnesota--Pulpwood marketing expanded 169,000 cords. Demand for aspen and pine was strong; birch and hardwood residue markets weakened.

Michigan--Pulpwood demand rose moderately (125,000 cords), mainly in aspen. Hemlock, balsam fir, tamarack, spruce, and softwood residue markets slackened. Michigan mills received only 3 percent of the softwood residue deliveries in the Lake States.

Industry Trends and Analysis

Pulpmill capacity expanded from 10.0 to 10.2 thousand tons per day (table 5). Increases were in the sulfite and mechanical processes. No mills closed or changed ownership. The industry is continuing to invest significantly in pollution control equipment and in sawmills. Captive sawmills supply a reliable quantity of pulpwood from their residues.

During the last decade (1965-1974), Lake States pulpwood production did not keep pace with the national trend (fig. 3). In 1964, the Lake States produced 7.5 percent of the nation's pulpwood; in 1974, they produced 6.9 percent. During this period, pulp and paper industry growth was concentrated in the South. From 1971 to 1974, however, the Lake States relative position improved by 1 percent (from 5.9 to 6.9).

Aspen has been the dominant Lake States pulpwood species for many years, but its position is slipping (fig. 4). During the 1964-1971 period, aspen pulpwood output hovered close to half the total. By 1974, it had declined to 42 percent. Other hardwoods, both roundwood and residue, are increasing as a proportion of all pulpwood cut.

Pine and other softwood roundwood output has been stable since 1964. Use of Lake States softwood residue, minimal from 1964 to 1969, has risen every year since 1969 and is becoming more prominent in the pulpwood mix.

In the early 1960's, Michigan was the leading pulpwood producer. In 1967 Wisconsin took the lead and maintained it (fig. 5). Wisconsin production rose substantially in the last 10 years because the State's pulp-mills increased their use of local wood from 53 percent of their requirements in 1964 to 64 percent in 1974. The greater use of hardwoods created opportunities for the mills to purchase more wood locally.

Minnesota almost overtook Michigan in production during 1972. Then, a large Michigan pulpmill expanded its capacity and purchased much more Michigan wood. Consequently, Michigan pulled away from Minnesota in production during 1973-1974.

CENTRAL STATES

Production

Central States producers raised their pulpwood output to 486,000 cords, a 7 percent gain over 1973. Production rose because mills outside the Central States increased their pulpwood purchases from the region. Most of the gain came from hardwood residue, which increased to 58 percent of pulpwood output (table 6).

Missouri outproduced Illinois for the first time and may not relinquish its new position. Missouri has several large markets within and near the Central States. In 7 of the last 8 years, Missouri expanded its output an average of 25 percent per year.

Loggers harvested pulpwood in 120 counties: 39 in Missouri, 34 in Illinois, 31 in Indiana, and 16 in Iowa (fig. 6). The pulpwood harvest area shrank in southwest Illinois and south central Indiana. Meanwhile, harvesting expanded to 4 more counties in Missouri and 3 more in Iowa than in 1973.

Receipts

The 13 Central States' mills received 353,000 cords of pulpwood, which is down 7 percent from 1973. More of their wood came from the Central States than in 1973. Imports declined 28,000 cords--15,000 cords of roundwood and 13,000 cords of residue. The mills bought hardwood residue heavily. Soft hardwood receipts fell to their lowest level since 1955. After recording peak receipts in 1973, Illinois mills procured 17 percent less wood.

Figure 6.--Harvest of pulpwood bolts in the Central States by counties, in standard cords, 1974.

Industry Trends and Analysis

Pulping capacity was 1,415 tons per day, 100 tons below 1973 (table 7). One national firm is converting its large pulping operation in Illinois to use of wastepaper from a combination of pulpwood and wastepaper. Loss of this mill will be temporarily unsettling to its wood supplies. The long term affects on these

producers is uncertain because other pulp-mills in the area will buy wood from some of them.

Hardwood residue became the dominant source of Central States pulpwood in 1968 and is extending its position yearly (fig. 7). Since 1964 soft hardwood pulpwood harvests declined irregularly while hard hardwood harvests generally rose until 1970, then began declining.

2/ CAPACITY NOT AVAILABLE.

Figure 7.--Central States pulpwood production by year and type of wood, 1964-1974.

Hardwood residue has been successfully substituted for roundwood for several reasons. Strict air pollution control laws and enforcement caused many sawmills and veneer mills to find pulpwood

markets for their wood residues. Many mills sell residue chips profitably. Pulp-mill operators like residue chips because they require less handling and processing than roundwood, use less storage space, and the supply is steady except during deep recessions.

All four Central States increased pulpwood production from 1964 to 1974 (fig. 8). If the average annual rate of growth in output during this period continues in each State, Missouri will be the top producer in 1976.

Figure 8.--Central States pulpwood production by State, 1964-1974.

Blyth, James E., and Jerold T. Hahn.

1976. Pulpwood production in the North Central Region by county, 1974. USDA For. Serv. Resour. Bull. NC-29, 26 p., illus. North Cent. For. Exp. Stn., St. Paul, Minn.

Discusses 1974 pulpwood production and receipts and recent production trends in the Lake States and Central States. Gives pulpwood production in the Lake States by species for each county, and compares production by Forest Survey Unit with that of previous years. For the Central States, presents 1974 pulpwood production and receipt data by State, and shows four production classes by county.

OXFORD: 861.0(77):792. KEY WORDS: roundwood, residue, receipts, Lake States, Central States.

Blyth, James E., and Jerold T. Hahn.

1976. Pulpwood production in the North Central Region by county, 1974. USDA For. Serv. Resour. Bull. NC-29, 26 p., illus. North Cent. For. Exp. Stn., St. Paul, Minn.

Discusses 1974 pulpwood production and receipts and recent production trends in the Lake States and Central States. Gives pulpwood production in the Lake States by species for each county, and compares production by Forest Survey Unit with that of previous years. For the Central States, presents 1974 pulpwood production and receipt data by State, and shows four production classes by county.
