FOREWORD

Forest Inventory and Analysis (FIA) is a continuing endeavor as mandated by the Renewable Forest and Rangeland Resources Planning Act of 1974. Prior inventories were mandated by the McSweeney-McNary Forest Research Act of 1928. The objective of FIA is to periodically inventory the Nation's forest land to determine its extent, condition, and volume of timber, growth, and depletions. Up-to-date resource information is essential to frame intelligent forest policies and programs. USDA Forest Service regional experiment stations are responsible for conducting these inventories and publishing summary reports for individual States. The North Central Forest Experiment Station is responsible for forest resource evaluation in Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Wisconsin.

Fieldwork for the Indiana Statewide forest inventory was begun in July 1985 and completed in December 1986. Reports on the two previous inventories of Indiana's timber resource are dated 1950 and 1967.

More accurate survey information was obtained during the 1986 survey than otherwise would have been feasible because of intensified field sampling. Such sampling was made possible by additional funding provided by the Indiana State Legislature through the Division of Forestry, Indiana Department of Natural Resources. The Department also surveyed primary wood-using plants in the State. Data from this survey were used to help estimate the quantity of timber products harvested in the State. Indiana Department of Natural Resources personnel have also assisted in training field personnel, analyzing information obtained from the survey, and preparing this report.

Aerial photos used in the Indiana Knobs Forest Inventory were furnished by the Hoosier National Forest and the USDA Agricultural Stabilization and Conservation Service.

Information in this report includes the most commonly used Forest Inventory and Analysis statistics. However, additional forest resource data can be provided to interested users. Persons requesting additional information that can be provided from the raw inventory data are expected to pay the retrieval costs. These costs will vary depending on the complexity of the request, from less than \$100 for a relatively simple request to \$2,000 for a complex retrieval involving the services of a Forest Inventory and Analysis computer programmer. If requests for data conflict with ongoing Forest Inventory and Analysis work, they will be scheduled so as to minimize the impact on the work unit.

Requests for unpublished information may be directed to:

TIMBER RESOURCE OF THE INDIANA KNOBS UNIT, 1986

Mark H. Hansen, and Mark F. Golitz

HIGHLIGHTS

Forest Area

- Forest land was 1.8 million acres (43.5 percent of the Knobs Unit's total land area) in 1986.
- Timberland (formerly called commercial forest land) decreased 1.6 percent between 1967 and 1986, from 1,769,200 to 1,741,100 acres.
- Reserved timberland totaled 64,200 acres in 1986, 3.6 percent of the Unit's forest land. There were only 26,900 acres of reserved timberland in the Unit in 1967.
- Timberland represented 42 percent of the Unit's total land area.
- Perry County (fig. 1) contained the largest area of timberland in 1986 (152,500 acres) as it did in 1967 (142,800).
- Farmers and miscellaneous private individuals own 1,218,800 acres, 70 percent of the timberland (fig. 2). A new definition of farm ownership shifted much of what was previously in the farmer category into the miscellaneous private category.
- Of the 1,386,900 acres of privately owned timberland, 58 percent or 798,400 acres were owned by parties with between 11 and 100 acres of timberland.
- Sixty-nine percent (956,100 acres) of the privately owned timberland had been owned by its present owner less than 20 years.
- The predominant forest type, oak-hickory, accounted for 43 percent (741,300 acres) of the total timberland in 1986, down from 71 percent of the

Figure 2.—Area of timberland by owner, Indiana, Knobs Unit, 1986.

Figure 3.—Area of timberland by forest type, 1967 and 1986, Indiana, Knobs Unit.

total in 1966 (fig. 3). Much of the area of oak-hickory type is in older stands (68 percent are older than 50 years), while other types tend to be in younger stands (80 percent are younger than 70 years) (fig. 4).

The area of the oak-hickory type is declining for several reasons. Many mature oak-hickory stands where no cutting has taken place are succeeding into the maple-beech and cherry-ash-yellow-poplar types. In many oak-hickory stands where cutting has taken place, soft maple and yellow-poplar are the predominant species to regenerate, producing a different forest type.

- The area of sawtimber stands increased 28 percent between inventories, while the area of poletimber stands decreased 40 percent (fig. 5).

Figure 4.—Area of timberland by forest type and stand-age class, Indiana, Knobs Unit, 1986.

Figure 5.—Area of timberland by stand-size class, 1967 and 1986, Indiana, Knobs Unit.

Volume

- The volume of growing stock on timberland was 2.3 billion cubic feet in 1986, up 33 percent from 1967¹.
- Sawtimber volume on timberland totaled 8.7 billion board feet² in 1986, up 48 percent from 1967³.
- Hardwoods accounted for 95 percent of both the growing-stock volume (2.2 billion cubic feet) and the sawtimber volume (8.3 billion board feet) on the Unit's timberland.
- The oaks account for 42 percent (3.7 billion board feet) of the total sawtimber volume.
- Growing-stock volume of the oaks and hickories increased 3 percent between 1967 and 1986, while all other species increased 77 percent over the same period (fig. 6). The harvesting pressure on oak and hickory is apparent, as these species' total share of inventory declined from 60 to 47 percent of growing stock between 1967 and 1986. This decrease in oak as a percentage of the total volume is a major factor in the decline in the area of the oak-hickory forest type.
- Yellow-poplar growing-stock volume increased 160 percent, from 91 million cubic feet in 1967 to 236 million cubic feet in 1986 (fig. 6). The growing-stock volume of yellow-poplar was 5 percent of the total in 1967, compared to 10 percent of the total in 1986.

¹Because of changes in volume equations, 1967 growing-stock volumes have been adjusted from those published after the 1967 survey to conform to 1986 volumes.

²International 1/4-inch rule.

³Because of changes in survey procedures and volume equations, 1967 sawtimber volume figures have been adjusted from those published after the 1967 survey to conform to 1986 data.

Figure 6.—Growing-stock volume by species group, 1967 and 1986, Indiana, Knobs Unit.

Figure 7.—Growing-stock volume by species group and diameter, Indiana, Knobs Unit, 1986.

- Growing-stock volume on timberland averaged 1,345 cubic feet per acre in 1986, compared to 997 cubic feet per acre in 1967, an increase of 35 percent.
- Sawtimber volume per acre increased 51 percent, from 3,306 board feet in 1967 to 4,990 board feet in 1986.
- Fifty-seven percent (4.9 billion board feet) of the sawtimber volume on timberland is in trees between 11 and 17 inches d.b.h. (fig. 7).
- Forty-six percent (4.0 billion board feet) of the sawtimber volume is in stands aged 40 to 70 years.
- The volume in live cull trees is 208 million cubic feet; salvable dead tree volume is 42 million cubic feet.
- Private parties (all non-public owners) own 78 percent (1.8 billion cubic feet) of the growing-stock volume.
- The oak-hickory forest type contains 43 percent of the sawtimber volume (3.7 billion board feet).

Stand Conditions

- Net annual growth of growing-stock trees on timberland was 60 million cubic feet, 2.6 percent of inventory in 1985. In 1966, net annual growth of growing-stock trees was 42.7 million cubic feet, 2.4 percent of inventory.
- Net annual growth of growing-stock trees on timberland averaged 34.4 cubic feet per acre in 1985, up 43 percent from 1966 (24.1 cubic feet per acre) (fig. 8).
- Annual mortality of growing stock amounted to 22 million cubic feet, 1.0 percent of inventory in 1985.

Figure 8.—Net annual growth on timberland, 1966 and 1985, Indiana, Knobs Unit.

- Net annual growth of sawtimber on timberland was 302 million board feet, 3.5 percent of inventory in 1985. In 1966, net annual growth of sawtimber was 100 million board feet, 1.7 percent of inventory.
- Net annual growth of sawtimber trees on timberland averaged 174 board feet per acre in 1985, more than three times the rate in 1966 (57 board feet per acre) (fig. 8). This dramatic increase in sawtimber growth was primarily due to ingrowth, the volume of trees that had not yet reached the merchantable diameter limit (9 inches for softwoods, 11 inches for hardwoods) in 1967 but had reached those limits by 1986. This phenomenon is typical of a rapidly maturing second growth forest.
- Annual mortality of sawtimber amounted to 65 million board feet, 0.7 percent of inventory in 1985.

Timber Use

- Timber removals from growing stock totaled 41 million cubic feet in 1985 (1.7 percent of inventory and 68 percent of growth).
- Fifty-seven percent of the growing-stock removals were for saw logs (fig. 9).
- Sawtimber removals totaled 203 million board feet in 1985 (2.3 percent of inventory and 67 percent of growth).
- Oak and hickory growing-stock removals (24 million cubic feet) slightly exceeded growth (23 million cubic feet), but removals in all other species (17 million cubic feet) were less than half of growth (37 million cubic feet) (fig. 10).
- The oaks accounted for 52 percent (105 million board feet) of the sawtimber removals in 1985.
- Fuelwood produced totaled 14.5 million cubic feet in 1984. However, only 9 percent came from growing stock; the rest came from rough, rotten, and

Figure 9.—Growing-stock removals by item, Indiana, Knobs Unit, 1985.

Figure 10.—Growing-stock growth and removals by species group, Indiana, Knobs Unit, 1985.

dead trees (19 percent), plant residues (38 percent), and other sources (34 percent), primarily tops and limbs and trees from nonforest land.

Biomass

- Live tree biomass (trees larger than 1 inch in d.b.h.) totaled 136 million green tons (an average of 78.2 green tons per acre) in 1986.
- Highest yields of live tree biomass were in the chestnut scarlet oak (103 green tons per acre), oak-hickory (84 tons), and shortleaf pine (82 tons), forest types.
- Eighty percent (109 million green tons) of all live tree biomass was in growing-stock trees 5 inches d.b.h. and larger (fig. 11).

APPENDIX

Accuracy of Survey

Forest Inventory and Analysis information is based on a sampling procedure designed to provide reliable statistics at the State and survey unit levels. Consequently, the reported figures are estimates only. A measure of reliability of these figures is given by sampling errors. These sampling errors mean that the chances are two out of three that if a 100-percent inventory had been taken, using the same methods, the results would have been within the limits indicated.

For example, the estimated growing-stock volume in the Knobs Unit in 1986, 2,341.7 million cubic feet, has a sampling error of ± 1.95 percent (± 45.7 million cubic feet). The growing-stock volume from a 100-percent inventory would be expected to fall between 2,296.0 and 2,387.4 million cubic feet ($2,341.7 \pm 45.7$), there being a one in three chance that this is not the case.

The following tabulation shows the sampling errors for the 1986 Indiana Knobs Forest Inventory:

Item	Unit totals	Sampling error
Growing stock	(Million cubic feet)	(Percent)
Volume (1986)	2,341.7	1.95
Growth (1985)	60.0	3.24
Average annual removals (1966-1985)	31.3	7.26
Sawtimber	(Million board feet)	
Volume (1986)	8,688.8	2.39
Growth (1985)	302.2	5.58
Average annual removals (1966-1985)	131.6	7.87
Timberland	(Thousand acres)	
Area (1986)	1,741.1	0.83

As survey data are broken down into sections smaller than Survey Unit totals, the sampling error increases. For example, the sampling error for timberland area in a particular county is higher than that for total timberland area in the Unit. Table 81 shows the sampling errors for estimates smaller than Unit totals. For example, Harrison County, with 132.1 thousand acres (table 3), would have a sampling error of just under 3 percent. Similarly, the sampling error for the growing-stock volume of yellow-poplar in the unit (236.0 million cubic feet, table 30) would be between 5 and 10 percent.

Survey Procedures

Two-phase sampling, using both new and remeasurement ground plots, was used in this inventory.

The major steps in the Indiana Knobs Forest Inventory were as follows:

1. Aerial photography (phase 1).

Aerial photographs of the entire area were obtained from the Hoosier National Forest and the USDA Agricultural Stabilization and Conservation Service. Nine-inch square, black and white Panchromatic prints on a scale of 1:40,000 were used throughout the entire unit. The photographs were taken on the following dates:

County	Date	County	Date
Brown	10/80	Morgan	10/80
Clark	6/80	Orange	9/79
Crawford	11/79	Owen	10/80
Dubois	11/79	Perry	11/79
Floyd	10/80	Scott	10/80
Harrison	10/81	Spencer	9/74
Jackson	10/80	Warrick	6/80
Lawrence	9/79	Washington	10/80
Monroe	10/80		

The locations of the plots used in the 1967 inventory were transferred to these new photographs. Photographs were assembled into township mosaics, and a systematic grid of 121 points (190.4 acres per point) was overlaid on each township mosaic. Each of these points (both the new systematic grid points and the old sample plots) was examined by aerial photogrammetrists and classified stereoscopically based on land use. If trees were present, forest type and stand size-density class were recorded. Then all the old sample locations and a sample of the new points were sent to the field for the field crew to verify the photo classification and to take further measurements. A total of 22,933 points (21,877 new and 1,056 old) was examined stereoscopically. The following tabulation summarizes the results of this step of the inventory:

Aerial photo classification	Points classified
Timberland	9,665
Reserved timberland	277
Questionable	253
Nonforest with trees	639
Nonforest without trees	11,834
Water	265
Total	22,933

2. Plot measurements (phase 2).

Each plot location was visited on the ground by a Forest Service field crew. They classified the plot based on its current land use and recorded various other descriptive information. The following tabulation summarizes the results of this step of the inventory:

Ground classification	Old plots remeasured	New plots established	Total ground plots taken
Timberland	460	409	869
Reserved timberland	12	45	57
Nonforest with trees	65	62	127
Nonforest without trees	503	525	1,028
Water	16	16	32
Total	1,056	1,057	2,113

On those plots classified as timberland, wooded pasture, or windbreak (at least 120 feet wide), a ground plot was established or remeasured. The ground plot consisted of a 10-point cluster covering approximately 1 acre. At each point, trees 5 inches or more in d.b.h. were sampled on a 37.5 Basal Area Factor (BAF) variable-radius plot and trees less than 5 inches d.b.h. were sampled on a 1/300-acre fixed-radius plot.

3. Area estimates.

Area estimates outside of the Hoosier National Forest were made using two-phase estimation methods. In this type of estimation, a preliminary estimate of area by land use is made from the aerial photographs (phase 1) and corrected by the plot measurements (phase 2). A complete description of this estimation method is presented by Loetsch and Haller⁴. Estimates of area for a particular county are based on the aerial photo points taken in that county, corrected using all the ground plots in the Survey Unit regardless of the county in which they were taken. This was done because there were not enough ground plots in any one county to accurately correct the aerial photo interpretation in that county. Unit-wide correction rates should be accurate at the county level because we have made every effort to ensure that the plot interpretation is consistent throughout the Knobs Unit.

Area estimates within the Hoosier National Forest were obtained from compartment examination records maintained by the Forest Timber

Management Staff. This is an intensive area inventory system in which, over a period of years, each stand in the Hoosier is mapped on aerial photographs and then classified by ground visits.

4. Volume estimates.

Estimates of volume per acre are made from the trees measured on the 10-point plots. Estimates of volume per acre were multiplied by the area estimates to obtain estimates of total volume. Net cubic foot volumes are based on equations developed by Smith and Weist⁵ for use in Indiana. Board foot International 1/4-inch, board foot Doyle, and cubic foot volume in saw log estimates are developed based on factors derived from full tree measurements taken throughout the Central States (Illinois, Indiana, Iowa, and Missouri) and an equation developed by Wiant and Castenaeda⁶. Biomass estimates are based on equations developed by Smith⁷. These factors are shown in table 1.

5. Growth and mortality estimates.

On remeasurement plots, estimates of growth and mortality per acre come from the remeasured diameters of trees and observation of trees that died between inventories. Growth is reported for 1985, the last year before the inventory, and is based on an assumption of constant basal area growth over the remeasurement period. Mortality is reported for 1985 also, and is based on an assumption of constant volume mortality over the remeasurement period.

On new plots, where trees were not remeasured, estimates of growth and mortality were obtained

25.0-26.9	5.3753	4.8778	5.9153	4.3566	.7918	.7361
27.0-28.9	5.3753	4.8778	5.3148	4.4843	.7918	.7361
29.0+	5.3753	4.8778	5.8066	4.9115	.7918	.7361

by using the Central States Stand and Tree Evaluation and Modeling System (STEMS)⁸⁹ to project the growth and mortality of trees for 1 year. The STEMS growth model was adjusted to meet local conditions, using the data from the remeasured plots and a method developed by Smith¹⁰. As with volume, total growth and mortality estimates were obtained by multiplying the per acre estimates by area estimates.

6. Average annual removals estimates.

Average annual growing-stock and sawtimber removals (1966 to 1985) were estimated only from the remeasurement plots. These estimates are obtained from trees measured in the last survey and cut or otherwise removed from the timberland base. New plots were not used to estimate removals. Because the remeasurement plots made up only half of the total ground plots, average annual removals estimates have greater sampling errors than volume and growth estimates.

7. Timber removals, utilization, and timber products output estimates.

Statistics on timber products output during 1984 came from canvassing (with a formal questionnaire) all the known primary wood-using mills that consume Indiana logs and bolts. Indiana Department of Natural Resources (IDNR) foresters personally canvassed all the known Indiana primary mills (except one pulpmill). IDNR utilization and marketing specialists provided estimates based on prior knowledge and contacts for a few mills that did not furnish complete data.

The North Central Forest Experiment Station mailed a formal questionnaire to the Indiana pulpmill and all known out-of-State mills using Indiana roundwood. Follow-up on nonrespondents was by mail and telephone.

A sample of Illinois households and fuelwood producers provided estimates of fuelwood and post production in Illinois during 1983. Fuelwood and fencepost output in Indiana for 1984 was estimated by extrapolating the study results in Illinois to Indiana.

Wood utilization factors for converting timber products output to removals from growing stock were obtained during a 1984-1985 utilization study in Illinois, a 1971-1972 utilization study in Missouri, a 1966 utilization study in Indiana, and a 1964-1965 utilization study in Michigan.

Because this was a 100-percent sample of all primary wood-using mills, there is no sampling error reported for 1985 removals and timber products. This is not to say that the estimates reported here are totally accurate. Sampling error is a measure of precision, not accuracy, and tells in what range we would expect to obtain an estimate were we to repeat the procedure on a new sample. Because we

did a complete sample of all mills, were we to repeat the procedure we would expect the same results.

COMPARING INDIANA'S THIRD INVENTORY WITH THE SECOND INVENTORY

Data from new forest inventories are often compared with data from earlier inventories to determine trends in forest resources. However, changes in procedures and definitions between surveys often make it necessary to adjust earlier survey data so that they are comparable to data from the new survey. A consistency check was made for the Indiana Knobs Unit to ensure that the changes observed between inventories reflect actual changes in the resource and not changes in definitions or procedures.

Identifying and Correcting Procedural Changes

Between the 1967 and 1986 inventories of the Indiana Knobs Unit, some procedural changes were made in the method of deriving annual growth and mortality estimates and determining forest type. Also, different volume equations and forest types were used for the two inventories.

New volume equations were developed for Indiana, and these equations were used to compute the 1986 volumes and also to recompute the 1967 volume. The recomputed 1967 growing-stock volume was 2.2 percent greater than that reported in the 1967 report. Volumes for 1967 shown in this report are the recomputed volumes based on new volume equations and observations from the 1967 inventory.

Mortality figures published in the 1967 inventory report were based on field estimates from nonremeasurement plots. Information gathered on remeasurement plots during the current inventory was used to adjust the 1967 mortality figures. This adjustment, together with the new volume equations, also changed the estimate of net growth for the 1967 inventory.

In the 1967 report, fewer forest types were identified than in this report; however, all the types used in this report are subsets of forest types used in the old report. Areas and volumes in the oak-hickory type in 1967 will be in either the oak-hickory, chestnut-scarlet oak, or sassafras-persimmon type in 1986. Areas and volumes in the oak-gum-cypress

type in 1967 will be in either the oak-gum or lowland oak type in 1986. Similarly, the 1967 elm-ash-cottonwood type is made up of the elm-ash-soft maple and cottonwood types in 1986; and the 1967 maple-beech-birch type is made up of the maple-beech and cherry-ash-yellow-poplar types in 1986. We could not divide the 1967 area up by the 1985 types, so all comparisons must be made by combining 1986 data together into the 1967 types.

Checking for Consistency

A test was made to ensure that it was possible to move from the adjusted 1967 resource statistics to the 1986 values by means of a computer program for updating and projecting timber volume, growth, and removals. Using the adjusted 1967 volume, growth rates, and removals rates for the period between the two surveys, the program projected the inventory from 1967 to 1986. The program outputs volume, net growth, and removals of growing stock for every year in the period. Thus, inconsistencies in volume, growth, and removals were identified and resolved.

This program estimates how volume, growth, and removals could have logically changed over the inventory period to be consistent with the estimates of past and current volume, growth, and removals, and average annual removals presented in this report. The growing-stock growth used for this program was increased by 6.1 million cubic feet per year in both 1967 and 1986 to account for nontimberland that is converting to timberland. Between 1967 and 1986, we found that 159,000 acres of nontimberland converted to timberland. The growing-stock volume on these lands was 115 million cubic feet in 1986. Removals did not require adjustment because they already include "other removals (see Definition of Terms in Appendix), which includes the volume of timber on lands that converted from timberland to nontimberland. Between 1967 and 1986, we found that 176,000 acres of timberland converted to nontimberland. The growing-stock volume on these lands was 149 million cubic feet in 1966.

Figure 12 is not intended to project beyond 1986, but simply shows one possible way in which volume, growth, and removals may have changed between 1966 and 1986 that is consistent with other information presented in this report. Removals tend to fluctuate from one year to the next, depending on economic conditions. Growth also fluctuates, depending on weather conditions, removals, insect and disease infestations, and other factors. Also, the

Figure 12.—*Growing-stock volume, growth and removals, Indiana, Knobs Unit, 1966 to 1986.*

past and current volume, growth and removals (which fix the end points of these lines), and average annual removals (which fix the midpoint of the removals line) are only estimates, and each has a sampling error. This figure simply shows that it is possible to move from the old information to the new information in a logical manner.

LOG GRADE

In the Indiana Knobs Unit field crews graded the butt log of every sawtimber tree on every plot. Butt logs were graded on the basis of external characteristics as indicators of quality. Hardwood species were graded according to "Hardwood Log Grades for Standard Lumber."¹¹ The best 12-foot section of the lowest 16-foot hardwood log, or the best 12-foot upper section if the butt log did not meet minimum log-grade standards, was graded as follows:

¹¹Vaughn, C. L.; Wollin, C. A.; McDonald, K. A.; Bulgrin, E. H. 1966. *Hardwood log grades for standard lumber. Res. Pap. FPL 63. Madison, WI: U.S. Department of Agriculture, Forest Service, Forest Products Laboratory. 52 p.*

Forest Service standard grades for hardwood factory saw logs

Grading factors		Specifications							
		Log grade 1			Log grade 2			Log grade 3	
Position in tree		Butts only	Butts and uppers		Butts and uppers			Butts and uppers	
Scaling diameter, inches		¹ 13-15	16-19	20 +	² 11 +	12 +		8 +	
Length without trim, feet		10 +			10 +	8-9	10-11	12 +	8 +
Required clear cuttings ³ of each of three best faces ⁴	Min. length, feet	7	5	3	3	3	3	3	2
	Max. number	2	2	2	2	2	2	3	No Limit
	Min. proportion of log length required in clear cutting	5/6	5/6	5/6	2/3	3/4	2/3	2/3	1/2
Maximum sweep and crook allowance	For logs with less than one-fourth of end in sound defects	15 percent			30 percent			50 percent	
	For logs with more than one-fourth of end in sound defects	10 percent			20 percent			35 percent	
Maximum scaling deduction		40 percent ⁵			50 percent ⁶			50 percent	

¹Ash and basswood butts can be 12 inches if they otherwise meet requirements for small #1's.

²Ten-inch logs of all species can be #2 if they otherwise meet requirements for small #1's.

³A clear cutting is a portion of a face, extending the width of the face, that is free of defects.

⁴A face is one-fourth of the surface of the log as divided lengthwise.

⁵Otherwise #1 logs with 41-60 percent deductions can be #2.

⁶Otherwise #2 logs with 51-60 percent deductions can be #3.

Forest Service standard specifications for hardwood construction logs (tie and timber logs)¹

Position in tree		Butt and upper
Min. diameter, small end		8 inches +
Min. length, without trim		8 feet
Clear cuttings		No requirements.
Sweep allowance, absolute		One-fourth of the diameter at the small end for each 8 feet of length.
Sound surface defects	Single knots	Any number, if no one knot has an average diameter above the callus in excess of one-third of the log diameter at point of occurrence.
	Whorled knots	Any number if sum of knot diameters above the callus does not exceed one-third of the log diameter at point of occurrence.
	Holes	Any number provided none has a diameter over one-third of the log diameter at point of occurrence, and none extends more than 3 inches into included timber. ²
Unsound surface defects		Same requirements as for sound defects if they extend into included timber. ² No limit if they do not.
End defects	Sound	No requirements.
	Unsound	None allowed; log must be sound internally, but will admit one shake not to exceed one-fourth the scaling diameter and will admit a longitudinal split not extending more than 5 inches into the contained timber.

¹These specifications are minimum for the class. If, from a group of logs, factory logs are selected first, thus leaving only nonfactory logs from which to select construction logs, then the quality range of the construction logs so selected is limited, and the class may be considered a grade. If selection for construction logs is given first priority, it may be necessary to subdivide the class into grades.

²Included timber is always square, and dimension is judged from small end.

Softwood species were graded according to the following specifications on the following page.

Log Grades for Eastern White Pine

Log grade	Minimum size Diameter	Length ¹	Sweep or crook allowance	Total cull allowance including sweep	Maximum weevil injury	Allowable knot size (inches) ² on three best faces or minimum clearness of four faces
	<i>Inches</i>	<i>Feet</i>	<i>-----Percent-----</i>		<i>Number</i>	<i>Inches</i>
1	12 & 13	8-16	20	50	0	Four faces clear full length
	14 +	10-16	20	50	0	Two faces clear full length, or four faces clear 50 percent length (6 feet min. length) ³
2	6 +	8-16	30	50	0	Sound knots i.e. ⁴ D/6 and less than 3 inches ⁵ Unsound knots: i.e. 1½ inches and for: butt, lots i.e. D/12 upper logs i.e. D/10 or four faces clear 50 percent of length
3	6 +	8-16	40	50	8-foot logs 1 weevil	Sound knots i.e. D/3 and less than 5 inches.
					10-foot + logs: 2 weevil	Unsound knots i.e. D/6 and less than 2½ inches.
4	6 +	8-16	50	50	No limit	No limit

¹Plus trim.

²Disregard all knots less than ½-inch diameter in all grades.

³The sum of the diameter of sound knots plus twice the sum of the diameter of unsound knots (in inches) is less than or equal to ½ of the diameter of the log (inches).

⁴i.e. means less than or equal to.

⁵D means d. i. b. of log at location of knot.

LOG GRADES FOR JACK PINE AND RED PINE

Grade 1: logs with three or four clear faces.¹²

Grade 2: logs with one or two clear faces.

Grade 3: logs with no clear faces.

After the tentative log grade is established, the log will be degraded one grade for each of the following, except that no log can be degraded below grade 3. Net scale after deduction for defect must be at least 50 percent of the gross contents of the log.

1. *Sweep.* Degrade any tentative 1 or 2 log one grade if sweep amounts to 3 or more inches and equals or exceeds one-third the diameter inside bark at small end.

2. *Heart rot.* Degrade any tentative 1 or 2 log grade if conk, massed hyphae, or other evidence of advance heart rot is found anywhere in it.

¹²A face is one-fourth of the circumference in width extending full length of the log. Clear faces are those free of: knots measuring more than ½-inch in diameter; overgrown knots of any size, holes more than ¼-inch in diameter. Faces may be rotated to obtain the maximum number of clear ones.

LOG GRADES FOR ALL OTHER SOFTWOOD LOGS

Grade 1

1. Logs must be 16 inches in diameter or larger, 10 feet or longer, and with deduction for defect not over 30 percent of gross scale.
2. Logs must be at least 75 percent clear on each of three faces.
3. All knots outside clear cutting must be sound and not over 2-½ inches in size.

Grade 2

1. Logs must be 12 inches in diameter or larger, 10 feet or longer, and with a net scale after deduction for defect of at least 50 percent of the gross contents of the log.
2. Logs must be at least 50 percent clear on each of three faces or 75 percent clear on two faces.

Grade 3

1. Logs must be 6 inches in diameter or larger, 8 feet or longer, and with a net scale after deduction for defect of at least 50 percent of the gross contents of the log.

(B) Percent clear refers to percent clear in one continuous section.

Swamp tupelo ¹⁵	<i>Nyssa sylvatica</i> var. <i>biflora</i>
Persimmon ¹⁴	<i>Diospyros virginiana</i>
Sassafras ¹⁵	<i>Sassafras albidum</i>
Other hardwoods	
Ohio buckeye ¹⁵	<i>Aesculus glabra</i>
Boxelder ¹⁵	<i>Acer negundo</i>
Kentucky coffeetree ¹⁴	<i>Gymnocladus dioica</i>
Black locust ¹⁴	<i>Robinia pseudoacacia</i>
White mulberry ¹⁵	<i>Morus alba</i>
Red mulberry ¹⁵	<i>Morus rubra</i>
Flowering dogwood ¹⁴	<i>Cornus florida</i>
Honeylocust ¹⁴	<i>Gleditsia triacanthos</i>
Northern catalpa ¹⁵	<i>Catalpa speciosa</i>
European alder ¹⁵	<i>Alnus glutinosa</i>
Noncommercial species ¹⁶	
Osage-orange	<i>Maclura pomifera</i>
Eastern hophornbeam	<i>Ostrya virginiana</i>
Apple	<i>Malus</i> spp.
American hornbeam	<i>Carpinus caroliniana</i>
Wild plum	<i>Prunus</i> spp.
Eastern redbud	<i>Cercis canadensis</i>
Pawpaw	<i>Asimina triloba</i>

DEFINITION OF TERMS

Average annual removals from growing stock.—The average net growing-stock volume in growing-stock trees removed annually for forest products (including roundwood products and logging residues) and for other uses (see other removals). Average annual removals of growing stock are reported for a period of several years (1966 to 1985 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures).

Average annual removals from sawtimber.—The average net board foot sawtimber volume of live sawtimber trees removed annually for forest products (including roundwood products and other uses (see other removals). Average Manual removals of sawtimber are reported for a period of several years (1966 to 1985 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures).

Basal area.—The area in square feet of the cross section at breast height of a single tree. When the basal area of all trees in a stand are summed, the result is usually expressed as square feet of basal area per acre.

Biomass.—The above-ground volume of all live trees (including bark and foliage) reported in green tons. Biomass is made up of 7 components:

Growing-stock stumps.—Biomass of a growing-stock tree 1-foot stump.

Growing-stock bole.—Biomass of a growing-stock tree from a 1-foot stump to a variable 4-inch top.

Growing-stock tops and limbs.—Biomass of a growing-stock tree from a 1-foot stump minus the growing-stock bole.

Cull stumps.—Biomass of a cull tree 1-foot stump.

Cull bole.—Biomass of a cull tree from a 1-foot stump to a variable 4-inch top.

Cull tops and limbs.—Biomass of a cull tree from a 1-foot stump minus the cull bole.

1- to 5-inch trees.—Biomass of all live trees from 1- to 5-inches in diameter at breast height.

Commercial species.—Tree species presently or prospectively suitable for industrial wood products. (Note: Excludes species of typically small size, poor form, or inferior quality such as hophornbeam, osage-orange and redbud.)

Commercial forest land.—(See timberland).

County and municipal land.—Land owned by counties and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

Cropland.—Land under cultivation within the past 24 months; including cropland harvested, crop failures, cultivated summer fallow, idle cropland used only for pasture, orchards, and land in soil improvement crops, but excluding land cultivated in developing improved pasture.

Cull.—Portions of a tree that are unusable for industrial wood products because of rot, form, or other defect.

Diameter classes.—A classification of trees based on diameter outside bark, measured at breast height (4½ feet above the ground). (Note: D.b.h. is the common abbreviation for diameter at breast height. Two-inch diameter classes are commonly used in Forest Inventory and Analysis, with the even inch the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h.)

Farm.—Any place from which \$1,000 or more of agricultural products were produced and sold during the year.

Farmer-owned land.—Land owned by farm operators. (Note: Excludes land leased by farm operators from nonfarm owners, such as railroad companies and States.)

Forest land.—Land at least 16.7 percent stocked by forest trees of any size, or formerly having had

¹⁶Individual noncommercial species were not classified as soft or hard hardwoods. Since they are predominately hard hardwoods, the entire group was classed as hard.

such tree cover, and not currently developed for nonforest use. (Note: Stocking is measured by comparing specified standards with basal area and/or number of trees, age or size, and spacing.) The minimum area for classification of forest land is 1 acre. Roadside, streamside, and shelterbelt strips of timber must have a crown width of at least 120 feet to qualify as forest land. Unimproved roads and trails, streams, or other bodies of water or clearings in forest areas shall be classed as forest if less than 120 feet wide. Also see definitions for tree, land, timberland, reserved timberland, stocking, and water.

Forest industry land.—Land owned by companies or individuals operating primary wood-using plants.

Forest type.—A classification of forest land based on the species forming a plurality of live tree stocking. Major forest types in the State are:

Jack-red-white pine.—Forests in which jack, red or white pine, singly or in combination, comprise a plurality of the stocking. (These species are generally found in plantations in Indiana.)

Shortleaf pine.—Forests in which shortleaf pine comprises a plurality of the stocking. (Primarily plantations in Indiana.)

Scotch-Virginia pine.—Forests in which Scotch and Virginia pines and eastern redcedar, singly or in combination, comprise a plurality of the stocking. (Common associates include oak, yellow-poplar, red maple, sassafras, and white pine.)

Oak-pine.—Forests in which hardwoods (usually white, scarlet, chestnut, northern red or black oaks), singly or in combination, comprise a plurality of the stocking but where pines or eastern redcedar comprise 25 to 50 percent of the stocking. (Common associates include gum, hickory, sassafras, and yellow-poplar.)

Oak-hickory.—Forests in which upland oaks or hickories, singly or in combination, comprise a plurality of the stocking, and less than 25 percent of the stocking is in white, Scotch, and Virginia pines or eastern redcedar. (Common associates include yellow-poplar, elm, maple, black walnut, black-locust, and sassafras.)

Chestnut-scarlet oak.—Forests in which chestnut oak or scarlet oak, singly or in combination, comprise a plurality of the stocking. (Common associates include eastern redcedar, black oak, white oak, and hickory.)

Sassafras-persimmon.—Forests in which sassafras and persimmon, singly or in combination, comprise at least 50 percent of the stocking. (Common associates include oak, yellow-poplar, elm, maple, and eastern redcedar.)

Oak-gum.—Bottomland forests in which tupelo, blackgum, sweetgum, oaks, or cypress, singly or in combination, comprise a plurality of the stocking. (Common associates include cottonwood, willow, ash, elm, hackberry, and maple.)

Swamp chestnut-cherrybark oak.—Bottomland forests in which wet site oaks such as swamp, chestnut, cherrybark, and pin oak, singly or in combination, comprise a plurality of the stocking. (Common associates are swamp white oak, bur oak, soft maple, and sycamore.)

Elm-ash-soft maple.—Forests in which lowland elm, ash, soft maple, and cottonwood, singly or in combination, comprise a plurality of the stocking. (Common associates include boxelder, willow, sycamore, and beech.)

Cottonwood.—Forests in which cottonwood comprises at least 50 percent of the stocking. (Associates include willow, elm, soft maple, and ash.)

Maple-beech.—Forests in which hard maple or beech, singly or in combination, comprise a plurality of the stocking. (Common associates include soft maple, elm, and basswood.)

Cherry-ash-yellow-poplar.—Forests in which black cherry, white ash, and yellow-poplar, singly or in combination, comprise a plurality of the stocking. (Common associates include oak, maple, black walnut, beech, basswood, and sycamore.)

Gross area.—The entire area of land and water as determined by the Soil Conservation Service, 1980.

Growing-stock trees.—Live trees of commercial species that meet specified standards of size, quality, and merchantability. (Note: Excludes rough and rotten trees.)

Growing-stock volume.—Net volume in cubic feet of growing-stock trees 5 inches d.b.h. and over, from one foot above the ground to a minimum 4 inch top diameter outside bark of the central stem or to the point where the central stem breaks into limbs. Cubic feet can be converted to standard cords by dividing by 79. One standard cord is 128 cubic feet of stacked wood, including bark and air.

Hard hardwoods.—Hardwood species with an average specific gravity greater than 0.50 such as oaks, hard maple and hickories.

Hardwoods.—Dicotyledonous trees, usually broad-leaved and deciduous. See soft hardwoods and hard hardwoods.

Idle farmland.—Includes former cropland, orchards, improved pastures, and farm sites not tended within the past 2 years and presently less than 16.7 percent stocked with trees.

Improved pasture.—Land currently improved for grazing by cultivating, seeding, irrigating, or clearing of trees or brush and less than 16.7 percent stocked with live trees.

Industrial wood.—All roundwood products, except fuelwood.

Land.—A. *Bureau of the Census.* Dry land and land temporarily or partly covered by water such as marshes, swamps, and river flood plains (omitting tidal flats below mean high tide); streams, sloughs, estuaries, and canals less than one-eighth of a statute mile wide; and lakes, reservoirs, and ponds less than 40 acres in area. This is the same definition that the Soil Conservation Service uses in the National Resource Inventory. Bureau of Census estimates of total land area where used in 1967; Soil Conservation Service estimates were used for 1986.

B. *Forest Inventory and Analysis.* The same as the Soil Conservation Service, except minimum width of streams, etc., is 120 feet and minimum size of lakes, etc., is 1 acre.

Live trees.—Growing-stock, rough, and rotten trees 1-inch d.b.h. and larger.

Log grades.—A classification of logs based on external characteristics as indicators of quality or value. (See Appendix for specific grading factors used.)

Logging residues.—The unused growing stock portions of trees cut or killed by logging.

Maintained road.—Any road, hard-topped or other surfaces, that is plowed or graded at least once a year. Includes rights-of-way that are cut or treated to limit herbaceous growth.

Marsh.—Nonforest land that characteristically supports low, generally herbaceous or shrubby vegetation and that is intermittently covered with water.

Merchantable.—Refers to a pulpwood or saw log section that meets pulpwood or saw log specifications, respectively.

Miscellaneous Federal land.—Federal land other than National Forest and land administered by the Bureau of Land Management.

Miscellaneous private land.—Privately owned land other than forest-industry and farmer-owned land.

Mortality.—The volume of sound wood in growing-stock and sawtimber trees that die annually.

National Forest land.—Federal land that has been legally designated as National Forest or purchase units, and other land administered by the USDA Forest Service.

Net annual growth of growing stock.—The annual change in volume of sound wood in live sawtimber and poletimber trees and the total

volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes.

Net annual growth of sawtimber.—The annual change in the volume of live sawtimber trees and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes.

Net volume.—Gross volume less deductions for rot, sweep, or other defect affecting use for timber products.

Noncommercial species.—Tree species of typically small size, poor form, or inferior quality that normally do not develop into trees suitable for industrial wood products.

Nonforest land.—Land that has never supported forests, and land formerly forested where use for timber management is precluded by development for other uses. (Note: Includes areas used for crops, improved pasture, residential areas, city parks, improved roads of any width and adjoining clearings, powerline clearings of any width, and 1- to 40-acre areas of water classified by the Bureau of the Census as land. If intermingled in forest areas, unimproved roads and nonforest strips must be more than 120 feet wide and more than 1 acre in area to qualify as nonforest land.)

a. *Nonforest land without trees.*—Nonforest land with no live trees present.

b. *Nonforest land with trees.*—Nonforest land with one or more trees per acre at least 5 inches d.b.h.

Nonstocked land.—Timberland less than 16.7 percent stocked with growing-stock trees.

Other removals.—Growing-stock trees removed but not utilized for products, or trees left standing but “removed” from the timberland classification by land use change. Examples are removals from cultural operations such as timber stand improvement work, land clearing, and changes in land use.

Ownership.—Property owned by one owner, regardless of the number of parcels in a specified area.

Ownership size class.—The amount of timberland owned by one owner, regardless of the number of parcels.

Owner tenure.—The length of time a property has been held by the owner.

Pasture.—Land presently used for grazing or under cultivation to develop grazing.

Pastured timberland.—Timberland for which the primary use is wood production, but is presently used for grazing.

Physiographic class.—A measure of soil and water conditions that affect tree growth on a site. The physiographic classes are:

Xeric sites.—Very dry soils where excessive drainage seriously limits both growth and species occurrence. Example: cedar barrens.

Xeromesic sites.—Moderately dry soils where excessive drainage limits growth and species occurrence to some extent. Example: dry oak ridge.

Mesic sites.—Deep, well-drained soils. Growth and species occurrence are limited only by climate.

Hydromesic sites.—Moderately wet soils where insufficient drainage or infrequent flooding limits growth and species occurrence to some extent. Example: better drained bottomland hardwood sites.

Hydric sites.—Very wet sites where excess water seriously limits both growth and species occurrence. Example: frequently flooded river bottoms and cypress swamps.

Plant byproducts.—Plant residues used for products such as mulch, pulp chips, and fuelwood.

Plant residues.—Wood and bark materials generated at manufacturing plants during production of other products.

Poletimber stands.—(See stand-size class.)

Poletimber trees.—Growing-stock trees of commercial species at least 5 inches d.b.h. but smaller than sawtimber size.

Reserved timberland.—Forest land sufficiently productive to qualify as timberland but withdrawn from timber utilization through statute, administrative regulation, designation, or exclusive use for Christmas tree production, as indicated by annual shearing. Formerly called productive-reserved forest land.

Rotten trees.—Live trees of commercial species that do not contain at least one 12-foot saw log or two saw logs 8 feet or longer, now or prospectively, and/or do not meet regional specifications for freedom from defect primarily because of rot; that is, when more than 50 percent of the cull volume in a tree is rotten.

Rough trees.—(a) Live trees of commercial species that do not contain at least one merchantable 12-foot saw log or two saw logs 8 feet or longer, now or prospectively, and/or do not meet regional specifications for freedom from defect primarily because of roughness or poor form, and (b) all live trees of noncommercial species.

Roundwood products.—Logs, bolts, or other round sections (including chips from roundwood) cut from trees for industrial or consumer uses. (Note: Includes saw logs, veneer logs, and bolts; cooperage logs and bolts; pulpwood; fuelwood; piling; poles; posts; hewn ties; mine timbers; and various other round, split, or hewn products.)

Salvable dead trees.—Standing or down dead trees considered merchantable by regional standards.

Saplings.—Live trees 1 to 5 inches d.b.h.

Sapling-seedling stands.—(See stand-size class.)

Saw log.—A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight and with a minimum diameter outside bark (d.o.b.) for softwoods of 7 inches (9 inches for hardwoods) or other combinations of size and defect specified by regional standards.

Saw log portion.—That part of the bole of sawtimber trees between the stump and the saw log top.

Saw log top.—The point on the bole of sawtimber trees above which a saw log cannot be produced. The minimum saw log top is 7 inches d.o.b. for softwoods and 9 inches d.o.b. for hardwoods.

Sawtimber stands.—(See stand-size class.)

Sawtimber trees.—Growing-stock trees of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs 8 feet or longer, and meeting regional specifications for freedom from defect. Softwoods must be at least 9 inches d.b.h. Hardwoods must be at least 11 inches d.b.h.

Sawtimber volume.—Net volume of the saw log portion of live sawtimber in board feet, International ¼-inch rule (unless specified otherwise) from stump to a minimum 7 inches top diameter outside bark (d.o.b.) for softwoods and a minimum 9 inches top d.o.b. for hardwoods.

Seedlings.—Live trees less than 1 inch d.b.h. that are expected to survive. Only softwood seedlings more than 6 inches tall and hardwood seedlings more than 1 foot tall are counted.

Short-log (rough tree).—Sawtimber-size trees of commercial species that contain at least one merchantable 8- to 11-foot saw log but not a 12-foot saw log.

Site class.—A classification of forest land in terms of inherent capacity to grow crops of industrial wood based on fully stocked natural stands.

Site index.—An expression of forest site quality based on the height of a free-growing dominant or codominant tree of a representative species in the forest type at age 50.

Soft hardwoods.—Hardwood species with an average specific gravity less than 0.50 such as gum, yellow-poplar, cottonwood, red maple, basswood, and willow.

Softwoods.—Coniferous trees, usually evergreen, having needles or scale-like leaves.

Stand.—A group of trees on a minimum of 1 acre of forest land that is stocked by forest trees of any size.

Stand-age class.—Age of the main stand. Main stand refers to trees of the dominant forest type and stand-size class.

Stand-area class.—The extent of a continuous forested area of the same forest type, stand-size class, and stand-density class.

Stand-size class.—A classification of stocked (see stocking) forest land based on the size class of live trees on the area; that is, sawtimber, poletimber, or seedlings and saplings.

a. *Sawtimber stands.*—Stands with half or more of live stocking in sawtimber or poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

b. *Poletimber stands.*—Stands with half or more live stocking in poletimber and/or sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

c. *Sapling-seedling stands.*—Stands with more than half of the live stocking in saplings and/or seedlings.

State land.—Land owned either by States or leased to them, for 50 years or more.

Stocking.—The degree of occupancy of land by trees, measured by basal area and/or the number of trees in a stand by size or age and spacing, compared to the basal area and/or number of trees required to fully utilize the growth potential of the land; that is, the stocking standard.

A stocking percent of 100 indicates full utilization of the site and is equivalent to 80 square feet of basal area per acre in trees 5 inches d.b.h. and larger. In a stand of trees less than 5 inches d.b.h., a stocking percent of 100 would indicate that the present number of trees is sufficient to produce 80 square feet of basal area per acre when the trees reach 5 inches d.b.h.

Stands are grouped into the following stocking classes:

Overstocked stands.—Stands in which stocking of trees is 130.0 percent or more.

Fully stocked stands.—Stands in which stocking of trees is from 100.0 to 129.9 percent.

Medium stocked stands.—Stands in which stocking of trees is from 60.0 to 99.9 percent.

Poorly stocked stands.—Stands in which stocking of trees is from 16.7 to 59.9 percent.

Nonstocked areas.—Commercial forest land on which stocking of trees is less than 16.7 percent.

Timberland.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization. (Note: Areas qualifying as timberland are capable of producing more than 20 cubic feet per acre per year of annual growth when managed. Currently inaccessible and inoperable areas are included except

when the areas involved are small and unlikely to become suitable for producing industrial wood in the foreseeable future.) Formerly called commercial forest land. Also see definition of pastured timberland.

Timber removals from growing stock.—The net volume of growing stock in growing-stock trees removed for forest products (including roundwood products and logging residues) and for other uses (see other removals). Timber removals from growing stock are reported for a single year (1985 in this report) and are based on information obtained from a survey of primary wood-using mills (see Survey Procedures).

Timber removals from sawtimber.—The net board-foot volume of live sawtimber trees removed for forest products (including roundwood products and logging residues) and for other uses (see other removals). Timber removals from sawtimber are reported for a single year (1985 in this report) and are based on information obtained from a survey of primary wood-using mills (see Survey Procedures).

Timber products output.—All timber products cut from roundwood and byproducts of wood manufacturing plants. Roundwood products include logs, bolts, or other round sections cut from growing-stock trees, cull trees, salvable dead trees, trees on nonforest land, noncommercial species, sapling-size trees, and limbwood. Byproducts from primary manufacturing plants include slabs, edging, trimmings, miscuts, sawdust, shavings, veneer cores and clippings, and screenings of pulp mills that are used as pulpwood chips or other products.

Trees.—Woody plant having a well-developed stem and usually more than 12 feet tall at maturity.

Tree biomass.—The total aboveground weight (including the bark) of all trees from 1 to 5 inches in d.b.h., and the total aboveground weight (including the bark) from a 1-foot stump for trees more than 5 inches in diameter.

Tree size class.—A classification of trees based on diameter at breast height, including sawtimber trees, poletimber trees, saplings, and seedlings.

Upper stem portion.—That part of the bole of sawtimber trees above the saw log top to a minimum top diameter of 4 inches outside bark or to the point where the central stem breaks into limbs.

Urban and other areas.—Areas within the legal boundaries of cities and towns; suburban areas developed for residential, industrial, or recreational purposes; schoolyards; cemeteries; roads; railroads; airports; beaches; powerlines and other

rights-of-way; or other nonforest land not included in any other specified land use class.

Urban forest land.—Land that would otherwise meet the criteria for timberland, but is in an urban-suburban area surrounded by commercial, industrial, or residential development.

Water.—(a) *Bureau of the Census.*—Permanent inland water surfaces, such as lakes, reservoirs, and ponds at least 40 acres in area; and streams, sloughs, estuaries, and canals at least one-eighth of a statute mile wide. This is the same definition that the Soil Conservation Service uses in the National Resource Inventory. Bureau of Census estimates of total water area were used in 1967; Soil Conservation Service estimates were used for 1986.

(b) *Noncensus.*—Permanent inland water surfaces, such as lakes, reservoirs, and ponds from 1 to 39.9 acres in area; and streams, sloughs, estuaries, and canals from 120 feet to one-eighth of a statute mile wide.

Windbreaks.—A group of trees whose primary use is to protect buildings currently in use.

Wooded pasture.—Improved pasture with more than 16.7 percent stocking in live trees but less than 25 percent stocking in growing-stock trees. Area is currently improved for grazing or there is other evidence of grazing.

Wooded strip.—An acre or more of natural continuous forest land that would otherwise meet survey standards for timberland except that it is less than 120 feet wide.

Woodland.—Forest land incapable of producing 20 cubic feet per acre of annual growth or of yielding crops of industrial wood under natural conditions because of adverse site conditions. (Note: Adverse conditions include shallow soil, dry climate, poor drainage, high elevation, steepness, and rockiness.) Formerly called unproductive forest land.

TABLE TITLES

Area

Hansen, Mark H.; Golitz, Mark F.

1988. Timber resource of the Indiana Knobs Unit, 1986. Resour. Bull. NC-104. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 92 p.

The third inventory of Indiana's timber resource shows that commercial forest area in the Knobs Unit decreased less than 2 percent between 1967 and 1986, from 1,769 to 1,741 thousand acres. During the same period growing-stock volume increased 33 percent. Highlights and statistics are presented on area, volume, growth, mortality, and removals.

KEY WORDS: Area, volume, growth, mortality, removals.
