Michigan Timber Industry

An Assessment of Timber Product Output and Use

James E. Blyth, Anthony K. Weatherspoon, and W. Brad Smith

1988**

FOREWORD

In this bulletin we discuss recent Michigan forest industry trends and report the results of a detailed study of forest industry, industrial roundwood production, and associated primary mill wood and bark residue in Michigan in 1984. Such detailed information is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, and forest industry development. Likewise, researchers need current forest industry and industrial roundwood information for planning projects.

Special thanks are given to the primary wood-using firms that supplied information for this study and to the Michigan Department of Natural Resources foresters who canvassed these respondents. Their cooperation is greatly appreciated.

All board feet data in this report have been converted to International 1/4-inch scale by applying a multiplier of 1.08 to all saw log volume reported in Scribner Dec. C scale by sawmills, a multiplier of 1.04 to all veneer log volume reported in Scribner Dec. C scale by veneer mills, a multiplier of 1.38 to all saw log volume reported in Doyle scale by sawmills, and a multiplier of 1.14 to all veneer log volume reported in Doyle scale by veneer mills.

The last published report from a detailed study of all industrial roundwood output in Michigan was in 1977. Most comparisons in this report are with the 1977 study results. Quantities shown may vary slightly from one table to another because of rounding differences, but these differences are insignificant.

MICHIGAN TIMBER INDUSTRY—AN ASSESSMENT OF TIMBER PRODUCT OUTPUT AND USE

James E. Blyth,
Anthony K. Weatherspoon,
and W. Brad Smith

HIGHLIGHTS

- Michigan industrial roundwood production climbed to 284.2 million cubic feet in 1984 from 216.3 million cubic feet in 1977.
- Pulpwood accounted for 61 percent of the industrial roundwood harvest, compared to 55 percent in 1977.
- Three species (aspen, hard maple, and red oak) supplied 53 percent of the harvest.
- Michigan produced a record high 2.40 million cords of pulpwood in 1984. This record was broken in 1986 when production was 2.81 million cords, based on the North Central Station's annual study of pulpwood production.
- Aspen constituted 44 percent of the roundwood cut for pulpwood.
- Michigan pulp mills procured all but 3 percent of their wood requirements within the State.
- Saw log production rose from 514 million board feet in 1977 to 530 million board feet in 1984.
- Principal saw log species were hard maple, red oak, aspen, and soft maple.
- Average lumber output per sawmill rose 9 percent from 1977 to 1984.
- Michigan loggers cut 31.8 million board feet of veneer logs, 26 percent less than in 1977.
- Logging residue generated in 1984 was estimated to be the equivalent of 802 thousand cords of pulpwood, enough to supply three 500-ton/day pulp mills for 1 year.
- Eighty-eight percent or more of each residue class (coarse, fine, bark) generated at Michigan primary mills was used.

JAMES E. BLYTH is a Principal Market Analyst with the North Central Forest Experiment Station, St. Paul, Minnesota;

Anthony K. Weatherspoon is the Unit Leader, Utilization and Marketing, Michigan Department of Natural Resources, Lansing, Michigan; and **W. Brad Smith** is a Principal Mensurationist with the North Central Forest Experiment Station, St. Paul, Minnesota.

PRIMARY TIMBER INDUSTRY— INDUSTRIAL ROUNDWOOD

In terms of volume of wood used, pulp mills dominate Michigan forest industry but sawmills far outnumber any other mill category. Based on studies since 1969, the active (operating) mill population has been in a narrow range from 347 in 1969 to 293 in 1975. Active mills declined by only 4 from 1977. By contrast, 1,530 mills operated in 1954. Small sawmills constituted most of the decline in active mills between 1954 and 1969. Of 316 primary mills operating in 1984, 275 were sawmills. Compared to 1977, 6 more large sawmills operated in 1984 as well as 8 more medium sawmills, but the number of small sawmills operating fell by 23.

Since at least 1954, the annual quantity of logs and bolts used per mill has increased. Most mills built since 1954 have been larger than average for their mill type, and most mills that closed were small and inefficient. Although the industry is scattered throughout the State, major mills are concentrated in the northern two-thirds of Michigan (fig. 1).

Michigan's timber industry shared in the national recovery from recession. National markets for wood products in 1984 were good because the U.S. was recovering from a recession. Housing starts were 1.745 million units, an increase of 2.4 percent from 1983 and the highest total since 1979. Wood and upholstered furniture manufacturers had a good year; new orders and shipments each totaled nearly \$12 billion. U.S. lumber production in 1984 was 36.8 million board feet, 5.5 percent above the average for 1975 to 1984. Domestic paper and paperboard production reached a new high in the U.S. of 69 million tons, up 5.6 percent from the previous peak in 1983.

Figure 1.—Active primary wood-using mills and forest survey units in Michigan, 1984. Sawmills are classed by volume of lumber produced in 1984: large = 5 million board feet or more; medium = 1 to 4,999 million board feet (smaller sawmills not shown). Forest survey units are the geographic areas used by the Forest Inventory and Analysis Project to report periodic inventories and use of the Nation's forest resources.

Log and bolt receipts at active mills (excluding fuelwood and receipts at treating plants) were 230.6 million cubic feet, up 31 percent from 1977 and double the receipts in 1954. Hardwoods accounted for about four-fifths of the receipts.

Industrial roundwood production rose from 216.3 million cubic feet in 1977 to 284.2 million cubic feet in 1984. Annual production increases averaged 1.9 percent for softwoods and 4.7 percent for hardwoods. Industrial roundwood output climbed in every Unit except the Southern LP:

Survey Unit	Roundwood production		Change
	1977	1984	
	(Million cubic feet)		(Percent)
EUP	49.6	62.8	+27
WUP	63.3	78.4	+24
NLP	82.4	124.1	+51
SLP	21.0	18.9	-10
Total	216.3	284.2	+31

Marquette, Iron, Delta, Menominee, and Gogebic Counties each produced more than 10 million cubic feet of industrial roundwood.

From a volume standpoint, pulpwood strengthened its dominant market position between 1977 and 1984 while the saw-log position weakened but held firmly in second place. Industrial roundwood products Statewide in 1984 and 1977 ranked in order of output were:

Product	Roundwood Production	
	1977	1984
	(Percent)	
Pulpwood	54.6	61.3
Saw logs	41.0	32.1
Veneer logs	2.7	1.5
Other	1.7	5.1

Proportionally, industrial roundwood production shifted slightly to the Northern LP from the other Units between 1977 and 1984.

Aspen, hard maple, and red oak, the leading species cut, supplied 53 percent of the industrial roundwood harvest in 1984. Harvesting of each major species, except balsam fir, increased from 1977:

Survey Unit	Roundwood production		Change
	1977	1984	
	(Million cubic feet)		(Percent)
Aspen	68.4	91.9	+34
Hard maple	20.4	31.9	+56
Red oak	22.6	27.8	+23
Soft maple	13.9	19.8	+42
Jack pine	17.5	17.6	+1
Red pine	9.0	11.7	+30
Paper birch	6.0	8.5	+42
Spruce	5.0	7.9	+58
Balsam fir	9.2	7.8	-15
Cedar	3.7	7.7	+108
Other species	40.6	51.6	+27
Total	216.3	284.2	+31

Largest percentage gains since 1977 for primary species were in cedar, spruce, and hard maple.

PULPWOOD

During 1984 Michigan produced 2.40 million cords of pulpwood, which was a record high at that time. Ninety-two out of every 100 cords were roundwood (including chips from roundwood); the remainder was wood residue from sawmills, veneer mills, and other mills. In the late 1960's, residue became an important pulpwood source and has contributed more than 100 thousand cords annually since 1969.

In the late 1940's, hardwood accounted for about one-third of the roundwood cut. Since then, the hardwood proportion of roundwood has grown to about two-thirds of the total.

Annual harvests of aspen, the leading pulpwood species, have nearly quadrupled during the last 35 years. Harvesting of other hardwoods began after World War II and, by the late 1950's became an important segment of the pulpwood cut. The annual harvest of birch has doubled during the last decade. Major hardwood species cut for pulpwood in 1984 were:

Species	Hardwood pulpwood
	(Thousand cords)
Aspen	962
Hard maple	145
Soft maple	138
Red oak	126
Paper birch	79

Between 1946 and 1958, balsam fir was the leading softwood species for 9 years and hemlock was the leader for 3 years. Since 1958, pine has been the major softwood pulping species cut. After 1975 the annual pine harvest exceeded 250 thousand cords except for 1981. Composition of the 1984 pine cut was jack pine (64 percent), red pine (27 percent), and white pine (9 percent). During the last two decades, the annual harvest of balsam fir, hemlock, and spruce has not shown any definite trends.

About 4 out of 5 cords of Michigan pulpwood cut in 1984 remained in the State. Most (95 percent) of the exports went to Wisconsin. Principal exports were aspen, hard maple, jack pine, and spruce.

The Northern LP supplies more roundwood pulpwood than any other Unit although annual production there between 1980 and 1984 was less stable than in the UP. Counties furnishing more than 100,000 cords each were Marquette, Iron, Delta, and Menominee.

Nine Michigan mills (7 pulp, 1 particleboard, and 1 waferboard) received 2.00 million cords of pulpwood in 1984; only 3 percent came from out-of-State. Hardwood mill residue was the principal import. Receipts were strong for aspen, jack pine, red oak, and soft maple.

During the late 1940's, Michigan mills imported more than one-third of their pulpwood from Canada. Then Canadian imports began falling and have been nominal since 1969. Wisconsin has been the major source of imported wood since 1973.

SAW LOGS

Michigan loggers harvested 530 million board feet of saw logs in 1984, up 16 million board feet from 1977. Eighty-seven percent was hardwoods. Major species cut were:

Species	Saw log production volume (Million board feet, Int'l 1/4-inch rule)
Hard maple	115
Red oak	94
Aspen	85
Soft maple	47

Ten percent of the saw log volume was shipped to Wisconsin and Indiana. Hard maple was the primary export species.

Major production gains since 1977 were in hard maple (24 million board feet), cedar (11 million board feet), red oak (11 million board feet), and soft maple (11 million board feet). Demand for red oak in furniture was high. Gains were mainly in the

Western UP for hard maple, in the Northern LP for cedar and red oak, and in the Western UP and Northern LP for soft maple.

Elm, aspen, and white pine production each declined more than 10 million board feet from 1977. Other significant declines were in jack and red pine. Elm saw log production changes since 1977 reflect the heavy destruction of elm in the Northern LP and Eastern UP and the spread of the disease in the Western UP:

Survey Unit	Elm saw log production (Thousand board feet, Int'l 1/4-inch rule)	
	1977	1984
Eastern UP	7,301	437
Western UP	8,589	3,256
Northern LP	2,980	378
Southern LP	332	580

Saw log harvesting in the Northern LP and Western UP Units was more intensive in 1984 than in 1977. The Northern LP furnished 42 percent of the saw log volume, including 76 percent of the aspen, 68 percent of the red pine, and 57 percent of the red oak.

Leading saw-log producing counties were Gogebic, Marquette, and Luce. Sixteen counties each cut more than 10 million board feet.

In 1984, 275 active (operating) sawmills received 484 million board feet of saw logs compared with 457 million board feet received at 284 sawmills in 1977. Michigan imported a total of 7 million board feet of saw logs from Indiana, Wisconsin, and Ohio.

Average lumber output per sawmill rose 9 percent from 1977 to 1984. Output continues to rise because most mills that close are small, most new mills are larger than average, and other mills have improved their productivity. Northern LP was the leading lumber-producing Unit.

VENEER LOGS

Of the 31.8 million board feet of veneer logs cut in 1984 in Michigan, 35 percent remained in the State, 30 percent was shipped to Wisconsin, 24 percent was shipped to Canada, and the remainder was sent to Ohio, Indiana, Iowa, and Kentucky. Hard maple was the primary species cut followed by red oak, red pine, yellow birch, white pine, ash, and paper birch. Red pine and hard maple were the chief exports from Michigan. Top-producing counties were Luce, Houghton, Marquette, and Alger.

Veneer log production fell 11 million board feet from the 1977 level. Declines were concentrated in

aspen and yellow birch and were partially offset by significant gains in red pine, red oak, and hard maple. No red pine was harvested for veneer logs in 1977.

Eight Michigan veneer mills received 13.7 million board feet of logs and bolts, down 55 percent from 1977. Aspen accounted for most of the decline. Hard maple was the major species processed in Michigan, followed by red oak, white oak, and yellow birch. Michigan supplied four-fifths of the log volume to resident veneer mills; the remainder came from Indiana, Minnesota, Pennsylvania, Kentucky, Illinois, Ohio, and Wisconsin. White oak and red oak were the principal species imported.

OTHER PRODUCTS

Other industrial roundwood products (5 percent of all industrial roundwood) cut in Michigan in 1984 were poles, commercial posts, industrial fuelwood, charcoal wood, cabin logs, and shingle bolts. Industrial fuelwood accounted for 77 percent (161 thousand cords) of these other products. Two-thirds (69 percent) of the fuelwood was softwoods. Commercial posts (2.6 million) constituted another 18 percent of the other products; cedar was the leading post species. Nearly four-fifths of the posts were cut in the Eastern UP.

Residential fuelwood is a major nonindustrial product in Michigan; this study did not include sampling to estimate nonindustrial roundwood product output.

LOGGING RESIDUE

During 1984 loggers in Michigan generated an estimated 63.3 million cubic feet of logging residue. Logging residue includes all wood fiber left behind from trees cut during logging operations and not subsequently used. Total residue generated was equivalent to 802 thousand cords of pulpwood, enough wood to supply three 500-ton/day pulp mills for 1 year.

Six species accounted for two-thirds of the residue:

Species	Residue volume	
	(Million cubic feet)	(Percent of total)
Aspen	16.0	25
Hard maple	9.7	15
Red oak	4.8	8
Soft maple	4.5	7
Jack pine	4.2	7
Red pine	3.0	5

The Northern LP and the Western UP Units produced two-thirds of the residue:

Survey Unit	Residue volume	
	(Million cubic feet)	(Percent of total)
Eastern UP	15.9	25
Western UP	20.5	32
Northern LP	22.6	36
Southern LP	4.3	7
Total	63.3	100

Five counties—Marquette, Iron, Delta, Gogebic, and Menominee—each produced more than 3 million cubic feet of logging residue.

PRIMARY MILL RESIDUE

During 1984, Michigan primary wood-using mills (except the pulp, particleboard, and waferboard mills) generated 659 thousand green tons of coarse residue, 395 thousand green tons of fine residue, and 282 thousand green tons of bark. Much of this residue was used: 97 percent of the coarse, 88 percent of the fine, and 93 percent of the bark. Pulp mills consumed 56 percent of the coarse residue for fiber products, and industry and households consumed 34 percent for fuel. Fine residue was used primarily for industrial fuel, soil conditioners, mulch, livestock bedding, and poultry litter. Bark was used mainly for fuel.

Mills have found many additional markets for fine residue and bark since 1977. In 1977, only 66 percent of the fine residue and 69 percent of the bark were used. Most of the increased use by 1984 was for fuel:

Residue type	Residue used for fuel	
	1977	1984
	(Percent)	
Fine	17	39
Bark	25	56

Market proportions for coarse residue did not change greatly between 1977 and 1984.

Counties each producing more than 35 thousand green tons of coarse and fine residue in 1984 were Alger, Menominee, Baraga, Dickinson, Gogebic, and Houghton. Estimates of residue in 1984 by type of disposal for each county are found in the Appendix. Individuals or firms desiring residue can use the county data to pinpoint areas with the highest residue concentrations.

OUTLOOK

Growth of the U.S. economy, and particularly the midwestern economy, will be a major factor in determining the rate of growth in demand for Michigan industrial roundwood products. Changes in demand for housing, furniture, pallets, railroad ties, blocking, paper, and paperboard are all vitally important to Michigan's primary wood-using industry.

APPENDIX

STUDY METHODS

Data for this publication came from canvassing (with a formal questionnaire) all the known primary wood-using mills that use Michigan logs and bolts. The study was a cooperative effort of the Michigan Department of Natural Resources (MDNR) and the North Central Forest Experiment Station (NCFES). All canvassing in Michigan was done by the MDNR using mail and personal contacts; follow-up on nonrespondents was by mail, telephone, and personal contacts. MDNR utilization and marketing specialists provided estimates based on prior knowledge and contacts for a few Michigan mills that did not furnish complete data.

The NCFES mailed a formal questionnaire to all out-of-State mills using Michigan roundwood. Follow-up on nonrespondents was by mail and telephone.

Logging utilization factors were used to estimate the logging residue. These factors were determined from earlier Michigan logging studies by the NCFES.

The NCFES edited and compiled the data.

SAMPLING ERROR

Because all primary wood-using mills were canvassed, there is no sampling error for the roundwood products they used or the wood and bark residue they generated.

COMMON AND SCIENTIFIC NAMES OF TREE SPECIES MENTIONED

SOFTWOODS

Eastern white pine	<i>Pinus strobus</i>
Red pine	<i>Pinus resinosa</i>
Jack pine	<i>Pinus banksiana</i>
Spruce	
White spruce	<i>Picea glauca</i>

Between 1977 and 1984, the average annual increase in industrial roundwood production was 4 percent. Assuming we have no severe recessions, this average annual increase can probably be maintained during the next decade (1984-1994) in Michigan.

Black spruce	<i>Picea mariana</i>
Balsam fir	<i>Abies balsamea</i>
Eastern hemlock	<i>Tsuga canadensis</i>
Tamarack	<i>Larix laricina</i>
Northern white-cedar	<i>Thuja occidentalis</i>
HARDWOODS	
White oak	
White oak	<i>Quercus alba</i>
Bur oak	<i>Quercus macrocarpa</i>
Chinkapin oak	<i>Quercus muehlenbergii</i>
Swamp white oak	<i>Quercus bicolor</i>
Red oak	
Northern red oak	<i>Quercus rubra</i>
Black oak	<i>Quercus velutina</i>
Pin oak	<i>Quercus palustris</i>
Hickory	
Bitternut hickory	<i>Carya cordiformis</i>
Pignut hickory	<i>Carya glabra</i>
Shagbark hickory	<i>Carya ovata</i>
Yellow birch	<i>Betula alleghaniensis</i>
Hard maple	
Black maple	<i>Acer nigrum</i>
Sugar maple	<i>Acer saccharum</i>
Soft maple	
Red maple	<i>Acer rubrum</i>
Silver maple	<i>Acer saccharinum</i>
American beech	<i>Fagus grandifolia</i>
Ash	
Black ash	<i>Fraxinus nigra</i>
White ash	<i>Fraxinus americana</i>
Balsam poplar	<i>Populus balsamifera</i>
Aspen	
Bigtooth aspen	<i>Populus grandidentata</i>
Quaking aspen	<i>Populus tremuloides</i>
Eastern cottonwood	<i>Populus deltoides</i>
American basswood	<i>Tilia americana</i>
Black walnut	<i>Juglans nigra</i>
Elm	
American elm	<i>Ulmus americana</i>
Rock elm	<i>Ulmus thomasii</i>
Slippery elm	<i>Ulmus rubra</i>
Paper birch	<i>Betula papyrifera</i>

DEFINITION OF TERMS

Coarse mill residue.—Wood residue suitable for chipping such as slabs, edgings, and veneer cores.

Commercial forest land.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization by statute or administrative regulation. Generally, this includes areas suitable for growing crops of industrial wood in excess of 20 cubic feet per acre annually.

Consumption.—The quantity of a commodity, such as pulpwood, utilized.

Fine mill residue.—Wood residue not suitable for chipping such as sawdust and veneer clippings.

Forest industry land.—Land owned by companies or individuals operating primary wood-using mills.

Forest survey unit.—A geographical area (group of counties) used by the Forest Inventory and Analysis Project to report periodic inventories and use of the Nation's forest resources.

Industrial roundwood products.—Saw logs, pulpwood, veneer logs, poles, commercial posts, piling, cooperage logs, industrial fuelwood, shaving bolts, lath bolts, charcoal bolts, and chips from roundwood used for pulp or board products.

Industrial roundwood production.—The quantity of industrial roundwood harvested in a geographic area.

Industrial roundwood receipts.—The quantity of industrial roundwood received in a geographic area, regardless of the geographic source.

Logging residue.—The unused portions of trees cut or killed by logging.

National forest land.—Federal land that has been legally designated as national forest or purchase units, and other land under the administration of the USDA Forest Service.

Primary wood-using mills.—Mills receiving roundwood or chips from roundwood for processing into products.

Primary wood-using mill residue.—Wood materials (coarse and fine) and bark generated at manufacturing plants from roundwood processed into principal products. These residues include wood products (byproducts) obtained incidental to production of principal products and wood materials not utilized for some product.

Roundwood.—Logs, bolts, or other round sections cut from trees (including chips from roundwood).

Standard cord.—A stack of wood bolts (or the equivalent) encompassing 128 cubic feet of wood, bark, and air space. A cord of pulpwood contains 79 cubic feet of wood and 49 cubic feet of bark and

air space. A cord of fuelwood contains 70 cubic feet of wood and 58 cubic feet of bark and air space.

State land.—Land owned by States or land leased to these governmental units for 50 years or more.

^{1/}Includes industrial fuelwood, charcoal wood, cabin logs, and shingle bolts.

^{2/}Thousand cubic feet.

^{3/}Thousand board feet, International 1/4-inch rule.

^{4/}Standard cord contains 128 cubic feet including wood, bark, and air space.

^{5/}Thousand pieces.

Table 3.--Industrial roundwood receipts by type of mill in Michigan, 1954, 1965, 1972, 1977, and 1984
(In million cubic feet)

Kind of mill	All species					Softwoods					Hardwoods				
	1954	1965	1972	1977	1984	1954	1965	1972	1977	1984	1954	1965	1972	1977	1984

Blyth, James E.; Weatherspoon, Anthony K.; Smith, W. Brad.
1988. Michigan timber industry—an assessment of timber product output and use. Resour. Bull. NC-109. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 55 p.

Discusses recent Michigan forest industry trends; production and receipts of pulpwood, saw logs, and veneer logs; and production of other timber products in 1984. Reports on logging residue, on wood and bark residue generated at primary wood-using mills, and on disposition of this mill residue.

KEY WORDS: Pulpwood, saw logs, veneer logs, residue.
