FOREWORD

This bulletin contains the results of a detailed study of 1986 residential fuelwood production and sources in Michigan. Such detailed information is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, and forest industry development. Likewise, researchers need current fuelwood production information for planning projects. This report *does not* include information about harvesting for industrial fuelwood. Such information is included in reports covering wood use by primary processing plants.

Special thanks are given to the Michigan households and commercial fuelwood producers that supplied information for this study. Their cooperation is greatly appreciated.

We acknowledge with special thanks the Michigan Department of Natural Resources (MDNR) and its contractors for their diligence in phoning and obtaining answers from these households and commercial fuelwood producers.

Production and Sources of Residential Fuelwood From Roundwood in Michigan

W. Brad Smith and Anthony Weatherspoon

HIGHLIGHTS

NOTE: This report contains only information about fuelwood cut for residential fuelwood by households and commercial loggers. Information about fuelwood cut for industrial use and fuelwood originating from mill residues is not included in this report.

- Total residential fuel production from roundwood in 1986 was 1.5 million standard cords.
- More than 94 percent of residential fuelwood was cut by households; the remainder was cut by commercial producers.
- Oak and maple comprised 53 percent of the fuelwood cut.
- Private land supplied 88 percent of the fuelwood cut.
- Rural woodland furnished 74 percent of all residential fuelwood harvested.
- Of the remaining 26 percent cut from other land classes, 7 percent came from cities and villages; 14 percent came from fence rows, windbreaks, and rural yards; and 5 percent came from pasture, cropland, and other sources.
- Growing stock on timberland was a minor source of fuelwood statewide. An estimated 383 thousand cords (26 percent) came from growing stock on timberland. This differs by region, however, and in the Eastern Upper Peninsula Unit 46 percent of the 98 thousand cords of fuelwood harvested were from growing stock.
- Dead trees on timberland provided 26 percent of the fuelwood. Nongrowing stock on timberland was equally as important for fuelwood as growing stock.
- Commercial producers harvested nearly twice as much from growing stock as did households.

HISTORICAL FUELWOOD DEMAND

W. Brad Smith, Principal Mensurationist, received a B.S. degree in forestry and an M.S. degree in forest management from Purdue University. He joined the Forest Service in May 1977, and has been working with North Central's Forest Inventory and Analysis Unit since October 1977.

Anthony Weatherspoon, Utilization and Marketing Unit Leader, received a B.S. degree in wood science and technology from Colorado State University. After pursuing graduate studies in wood science at Colorado State he was employed by St. Regis Paper company in 1978. He joined the Michigan Department of Natural Resources in 1985 as the Unit Leader for Marketing and

Until the late 1800's, wood was the primary source of energy in the United States, but by 1900 wood provided only about 25 percent of this country's energy. Between 1949 and 1974, fuelwood use declined steadily for utilities, residences, and commercial businesses, although industrial fuelwood use increased steadily during that period. Wood supplied only 0.40 quads (0.40 quadrillion BTU's) or 2 percent of U.S. energy in 1972, the year before the Arab embargo sent oil prices spiraling upward. Between 1974 and 1981, spurred by higher prices for fossil fuels such as coal, oil, and natural gas, Americans increased their overall use of wood

fuels by 45 percent, according to the United States Department of Energy (DOE). In 1986 wood furnished about 0.78 quads of energy, approximately 1.5 percent of the Nation's total energy consumption.

Researchers at the Forest Products Laboratory of the USDA Forest Service estimate that American households burned 39 million cords of fuelwood during the 1985-1986 heating season, an amount equal to 15 percent of the Nation's total timber harvest¹. Since 1980 residential fuelwood consumption has declined about 4 percent nationally, but is expected to rebound. Demand for residential fuelwood is expected to exceed 50 million cords annually by the year 2010.

NEED FOR A PRODUCTION STUDY

Several questions have been asked about the magnitude of the fuelwood harvest and its impact on the forest resource. How much fuelwood is harvested from forest land? urban areas? fence-rows and windbreaks? pastures and cropland? How much fuelwood comes from public land? Does most of the fuelwood come from growing stock? Are dead trees an important source? Are commercial fuelwood producers a major source of fuelwood? What are the principal species cut? Where are the principal fuelwood-producing areas in Michigan? Are saw log markets threatened by fuelwood producers?

To answer these and other related questions in Michigan, a cooperative study of fuelwood production from roundwood was completed in 1986 by the North Central Forest Experiment Station and the Michigan Department of Natural Resources.

ANALYSIS OF PRODUCTION

¹From "Current and projected wood energy consumption in the United States" by Colin High of Dartmouth College and Ken Skog of the USDA Forest Products Laboratory for publication in the *Proceedings of the IGT Conference on Energy from Biomass and Wastes XIII*. (Draft)

The Southern Lower Peninsula Survey Unit supplied 52 percent of the 1.5 million cords of fuelwood cut from roundwood in 1986, the Northern Lower Peninsula Unit supplied 33 percent, and the Upper Peninsula Units supplied the remaining 15 percent.

Households cut all but 79 thousand cords in 1986. Harvesting by commercial producers was proportionally greatest in the Northern Lower Peninsula Unit:

Survey Unit	Production		
	Households	Loggers	Total
	(Thousand cords)		
Eastern U.P.	93.1	4.5	97.6
Western U.P.	113.1	10.3	123.4
Northern L.P.	442.9	54.1	497.0
Southern L.P.	769.9	10.4	780.3

Oak and maple were the principal fuelwood species, accounting for 53 percent of the total. Leading species cut were:

Species	Volume	Percent
	(Thousand cords)	
Red oak	296.5	20
Soft maple	230.0	15
Elm	175.4	12
Hard maple	165.8	11
White oak	99.0	7
Aspen	80.4	5

No other individual species supplied more than 80 thousand cords. Softwoods supplied less than 2 percent of the total.

Private land provided 88 percent of the fuelwood cut. Public land furnished more than 20 percent in each of the Upper Peninsula Units (fig. 1).

Figure 1.—Residential fuelwood production from roundwood by Forest Survey Unit and major owner class.

State land was the chief source of fuelwood from the public sector:

Public land class	Fuelwood volume (Thousand cords)	(Percent)
State	103.7	57
County and municipal	39.0	21
National forest	38.0	21
Other Federal	1.5	1
Total	182.2	100

Oak and maple were the primary species cut on State land.

Rural woodlands² supplied 3 out of every 4 cords of residential fuelwood in the State. The remainder came from diverse sources such as cities and villages; windbreaks, fencerows, and yards of homes in rural areas; and pasture and cropland. Rural woodland supplied more than 94 percent

² Rural woodland was assumed to be timberland for analysis.

Figure 2.—Residential fuelwood production from roundwood by Forest Survey Unit and major source of material.

of the fuelwood in the more heavily forested Upper Peninsula Units (fig. 2).

Of the 26 percent of fuelwood harvested on noncommercial forest and nonforest areas, 7 percent came from cities and villages; 13 percent came from fencerows, windbreaks, and rural yards; and 6 percent came from pasture, cropland and other sources. Elm, red oak, and soft maple were the principal fuelwood species cut on each of these land classes.

Eighty-four percent of all residential fuelwood produced from nontimberland sources came from the more heavily urbanized Southern Lower Peninsula Unit.

Growing stock (see definitions) on timberland was not the major source of fuelwood on a statewide basis. Of the 1.5 million cords of residential fuelwood cut from roundwood, an estimated 383 thousand cords (26 percent) came from growing stock on timberland. Producers cut another 722 thousand cords (48 percent) from nongrowing stock on timberland:

Source	Volume (Thousand cords)	Percent of total
Growing stock on timberland	383	26
Tops and limbs of growing stock trees	275	18
Cull trees and cull sections of growing stock trees	38	3
Dead trees on timberland	406	27
Saplings	2	— ³
All trees on nonforest and nontimberland	<u>394</u>	<u>26</u>
Total	1,498	100

None of the Units harvested large quantities of growing stock on timberland for fuelwood. The highest proportion cut from growing stock was in the Eastern Upper Peninsula Unit:

Unit	Growing stock volume (Thousand cords)	Percent of Unit total
Eastern Upper Peninsula	45	46
Western Upper Peninsula	31	25
Northern Lower Peninsula	134	27
Southern Lower Peninsula	<u>173</u>	22
State total	383	26

Sixty-one counties produced more than 1,000 cords of fuelwood from growing stock (fig. 3). Two counties—Ionia and Chippewa—cut more than 20,000 cords from growing stock in 1986.

Harvesting of dead trees on timberland for fuel became progressively heavier from north to south, ranging from 16 percent of fuelwood cut in the Eastern Upper Peninsula to 52 percent in the Southern Lower Peninsula. Red oak and elm were the primary species of dead trees harvested.

For reporting purposes, the volumes of several miscellaneous species were combined into the aggregate groups of "other hardwood" and "non-commercial" species. These data were considered too weak to report at the county level. Table 4 shows the distribution of these species as reported by households on a Survey Unit basis.

³ Less than 0.5 percent.

SUMMARY AND CONCLUSIONS

Total production of fuelwood from roundwood during 1986 in Michigan was 1.5 million cords. This volume of fuelwood contained sufficient heat value to replace approximately 150 million gallons of No. 2 fuel oil⁴. More than 98 percent of the fuelwood produced was from hardwoods.

The Southern Lower Peninsula Unit, which contains about 18 percent of the forest land, produced 52 percent of the residential fuelwood. The denser population in the Southern Lower Peninsula Unit (88 percent of the State's population) was a major reason for the greater intensity of fuelwood harvesting there.

Households outproduced commercial cutters by a ratio of 20 to 1 statewide. Private nonforest and nontimberland was the chief source of fuelwood. Seventy-three percent of the production was from rural woodlands, but nearly 1 out of every 3 cords cut on rural woodlands came from dead trees.

Growing stock on timberland was not the major source of fuelwood, accounting for only 26 percent of the production. Nongrowing stock on timberland was twice as important for fuelwood as growing stock. Dead trees on timberland accounted for nearly 4 out of 10 cords of fuelwood produced.

Commercial producers cut a nominal amount of residential fuelwood in 1986. However, for a given quantity of fuelwood, commercial producers cut three times as much from growing stock on timberland as households cut. If commercial producers become more important suppliers of residential fuelwood, the percentage of growing stock in the mix of fuelwood will probably rise.

Some forest managers and wood procurement managers in Michigan may fear that large quantities of fuelwood are being cut from growing stock that previously would have been used for saw logs and other forest products. Our study results should relieve some of their concerns.

⁴ In comparing heat value between fuels, a factor to consider is the energy required to produce and deliver the fuels to the consumer.

MICHIGAN

Figure 3.—Growing stock harvest for residential fuelwood from rural woodlands (timberland) in Michigan, 1986.

Much of the fuelwood is from dead trees unlikely to be suitable for other products and from trees on nonforest and nontimberland that are not generally a forest industry supply source. Large quantities of dead trees as well as tops and limbs, and trees on nonforest land will be available each year for fuelwood use.

During the next 5 to 10 years, growing stock is likely to become an increasing source of Michigan fuelwood, but primarily for industrial rather than residential use. Follow-up fuelwood studies at 5-year intervals would be useful in determining trends in harvesting growing stock for fuel. Monitoring changes in industrial fuelwood production will be of great importance in determining the proportion of fuelwood cut from growing stock on timberland.

Use of dead and cull trees on timberland for fuel can also contribute to forest productivity increases. As demand for fuelwood increases, more of these trees can be removed for a profit as fuel without need for subsidized incentives. Consequently, less money may be required for a given level of timber stand improvement than if fuelwood demand had remained at low levels.

STUDY METHODS

Data for this publication came from sampling Michigan households and canvassing all known commercial fuelwood producers with formal questionnaires approved by the Federal Office of Management and Budget.

Households

The respondent universe was all households in Michigan with listed telephones. Michigan was divided into three districts: (1) the Upper Peninsula, containing 107 thousand households; (2) the Northern Lower Peninsula, containing 280 thousand households; and (3) the Southern Lower Peninsula, containing 2.7 million households. The latter district includes the Detroit metropolitan area. County population and data

on number of occupied households were obtained from the Michigan Statistical Abstract, Nineteenth Edition 1985, 1980 Census.

A total sample size of about 4,600 households was selected based on funding available and a desired standard error of less than ± 10 percent statewide at one standard deviation. The sample size ranged from 8 households in Keweenaw County to 960 in Wayne County.

The number of interviews within each district was apportioned to each Survey Unit and county within the district, based on the population and occupied households. A random list of phone numbers was generated by a marketing research firm for each county using all of the listed three-digit phone exchanges. The total number of samples for each county was divided by the number of exchanges to distribute the sample throughout the county.

The telephone interviewers were instructed as follows:

1. Use only residential numbers as a contact—No businesses or institutions.
2. Assign the pre-determined four-digit number to each cover sheet and survey form to identify the sampling unit.
3. Make no call backs. If a number rings but no one answers, proceed to the next number.

MDNR personnel interviewed the sample households by phone using a formal questionnaire prepared by the North Central Forest Experiment Station. The survey was conducted during May and June 1986. Calls were made each weekday from 6:00 to 9:00 p.m. and Saturday from 9:00 a.m. to 9:00 p.m.

Initial editing was completed by MDNR personnel. The North Central Station did the final editing and compiled the data. Some respondents did not know the species cut for fuel,

except in general terms such as mixed hardwoods, oak, maple. Some assumptions were made to facilitate prorating the volume reported in general terms to specific species by county. The assumptions were:

Mixed hardwoods: For each county, prorate mixed hardwoods proportionately to each of the hardwood species specifically identified as being harvested in that county.

Oak: For each county in a Survey Unit, prorate to white and red oak on the basis of the inventory volume in the Unit at the time of the last inventory.

Maple: For each county in a Survey Unit, prorate to hard and soft maple on the basis of the inventory volume in the Unit at the time of the last inventory.

Hickory: For each county in a Survey Unit, prorate to pecan hickory and other hickory on the basis of the inventory volume for select hickory and other hickory at the time of the last inventory.

Sampling rates were about twice as high in the heavily populated Southern Lower Peninsula as in the Northern Lower Peninsula and four times higher than in the Upper Peninsula. Expansion factors were determined for households in each district by dividing the number of households in a district by the number of sample households in

that district. The factors were roughly 800 in the Southern Lower Peninsula, 400 in the Northern Lower Peninsula, and 200 in the Upper Peninsula. These expansion factors were used to estimate the total fuelwood production by households in each county.

Commercial Producers

A full list of potential commercial fuelwood producers was compiled for each county by the MDNR. Using a formal questionnaire similar to that used for households, MDNR personnel canvassed all of these commercial producers by phone during the spring of 1986. Possible duplicate sampling of commercial producers was minimized by questioning all sample households producing more than 20 cords of fuelwood to determine if they were commercial producers.

For estimating growing stock on timberland harvested for fuel, "rural woodland" (woodland outside city and village limits) was assumed to be timberland. Logging utilization factors for fuelwood were used in estimating the quantity of growing stock cut for fuelwood on timberland. The Station developed these factors in Michigan during 1964-1965 by measuring trees cut for fuelwood on active harvesting operations. For fuelwood cut from live trees on timberland, 63 percent was estimated to be growing stock sections. For fuelwood cut or collected from logging residue on timberland, an estimated 27 percent was growing stock sections.

APPENDIX

SAMPLING ERROR

All the reported figures are estimates based on sampling procedures that are designed to give accurate estimates of fuelwood production. A measure of reliability of these figures is given by sampling errors. The sampling error means that the chances are two out of three that the results for the sample differ by no more than the amount indicated from the results that would have been obtained if a 100 percent sample of all households and commercial producers had been made.

Sampling error for fuelwood production was ± 8.6 percent on a volume of 1.5 million cords.

Sampling errors by sample unit were as follows:

Sample Unit	Volume (Thousand cords)	Error (Percent)
Upper Peninsula	221.1	17.0
Northern Lower Peninsula	497.0	11.2
Southern Lower Peninsula	<u>780.3</u>	14.0
All Units	1,498.4	8.6

STUDY LIMITATIONS

Two components of total fuelwood production are not included in this report. First, fuelwood produced from wood residue generated at primary wood-using mills (such as sawmills and cooperage mills) is not included. However, a cooperative Michigan primary wood-using mill study by the Michigan Department of Natural Resources and the North Central Forest Experiment Station will provide an estimate of fuelwood produced from primary mill residue. Information on this source of fuelwood will be published in another paper.

Second, fuelwood produced from wood residue generated at secondary wood-using mills (such as millwork plants, furniture plants, and office and store fixture manufacturers) was not estimated. Secondary wood-using mill residue is a minor source of fuelwood that has no direct impact and only a nominal indirect influence on the forest resource used for fuel.

Households without listed telephones were not sampled. Study results may be slightly biased if the fuelwood harvest per household without listed phones is significantly different in quantity or sources from the fuelwood harvest per household with listed phones. Harvesting characteristics by these two groups was assumed to be similar, and expansion factors for estimating total fuelwood production took into account all households in Michigan.

Each sample household was asked how much fuelwood it cut during the previous 12 months. Each commercial producer was asked a similar question. Because the study was conducted during 2 months in 1986, the actual fuelwood harvest was for varying 12-month periods in 1985 and 1986 depending on when the respondent was called. For this paper, production has been dated from the 1986 heating season for ease of discussion and because the exact date does not affect the analysis or findings significantly.

DEFINITION OF TERMS

County and municipal land.—Land owned by counties and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

Forest industry land.—Land owned by companies or individuals operating primary wood-using mills.

Growing-stock trees.—Live trees of commercial species qualifying as desirable and acceptable trees. Excludes rough cull and rotten cull trees.

Growing-stock volume.—Net volume in cubic feet of growing-stock trees 5.0 inches d.b.h. and over, from a 1-foot stump to a minimum 4.0 inch top diameter outside bark of the central stem.

Indian land.—Tribal land held in fee but administered by the Federal Government.

Logging residue.—The unused portions of trees cut or killed by logging.

National Forest land.—Federal land that has been legally designated as National Forest or purchase units, and other land under the administration of the USDA Forest Service.

Nonforest land.—Land that has never supported forests, and land formerly forested where use for timber management is precluded by development for other uses. Includes areas used for crops, improved pasture, residential areas, city parks, improved roads of any width and adjoining clearings, power line clearings of any width and 1- to 40-acre areas of water classified by the Bureau of the Census as land.

Poletimber trees.—Growing-stock trees of commercial species at least 5.0 inches d.b.h., but smaller than sawtimber size.

Primary wood-using mills.—Mills receiving roundwood or chips from roundwood for processing into products.

Primary wood-using mill residue.—Wood materials (coarse and fine) and bark generated at manufacturing plants from roundwood processed into principal products. These residues include wood products (byproducts) obtained incidental to production of principal products and wood materials not utilized for some product.

Coarse mill residue.—Wood residue suitable for chipping such as slabs, edgings, and veneer cores.

Fine mill residue.—Wood residue not suitable for chipping such as sawdust and veneer clippings.

Roundwood.—Logs and bolts from harvested trees including chips from harvested trees.

Saw log portion.—That part of the bole of sawtimber trees between the stump and the saw log top.

Saw log top.—The point on the bole of sawtimber trees above which a saw log cannot be produced. The minimum saw log top is 7.0 inches d.o.b. for softwoods and 9.0 inches d.o.b. for hardwoods.

Sawtimber trees.—Growing-stock trees of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs 8 feet or longer, and meeting regional specifications for freedom from defect. Softwoods must be at least 9.0 inches d.b.h. Hardwoods must be at least 11.0 inches d.b.h.

Standard cord.—A pile of logs 4x4x8 feet (128 cubic feet including air space and bark). A cord of fuelwood contains 70 cubic feet of wood and 58 cubic feet of bark and air space.

State land.—Land owned by States or land leased to these governmental units for 50 years or more.

Timberland.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization. Areas qualifying as timberland have the capability of producing in excess of 20 cubic feet per acre per year of annual growth under management. Currently inaccessible and inoperable areas are included, except when the areas involved are small and unlikely to become suitable for production of industrial wood in the foreseeable future. In this paper, "woodland areas outside city or village limits (rural woodland)" were assumed to be timberland.

Upper stem portion.—That part of the bole of sawtimber trees above the saw log top to a minimum top diameter of 4.0 inches outside bark.

COMMON AND SCIENTIFIC NAMES OF TREE SPECIES MENTIONED

SOFTWOODS

Cedar	<i>Thuja occidentalis</i>
Balsam fir	<i>Abies balsamea</i>
Spruce	
White spruce	<i>Picea glauca</i>
Black spruce	<i>Picea mariana</i>
Hemlock	<i>Tsuga canadensis</i>
White pine	<i>Pinus strobus</i>
Red pine	<i>Pinus resinosa</i>
Jack pine	<i>Pinus banksiana</i>
Tamarack	<i>Larix laricina</i>

HARDWOODS

Ash	
Black ash	<i>Fraxinus nigra</i>
White ash	<i>Fraxinus americana</i>
Aspen	
Bigtooth aspen	<i>Populus grandidentata</i>
Quaking aspen	<i>Populus tremuloides</i>
Balsam poplar	<i>Populus balsamifera</i>
American basswood	<i>Tilia americana</i>
Paper birch	<i>Betula papyrifera</i>
Beech	<i>Fagus grandifolia</i>
Yellow birch	<i>Betula alleghaniensis</i>
Cottonwood	<i>Populus deltoides</i>
Elm	
American elm	<i>Ulmus americana</i>
Rock elm	<i>Ulmus thomastii</i>
Slippery elm	<i>Ulmus rubra</i>
Hickory	
Bitternut hickory	<i>Carya cordiformis</i>
Pignut hickory	<i>Carya glabra</i>
Shagbark hickory	<i>Carya ovata</i>
Hard maple	
Black maple	<i>Acer nigrum</i>
Sugar maple	<i>Acer saccharum</i>
Soft maple	
Red maple	<i>Acer rubrum</i>
Silver maple	<i>Acer saccharinum</i>
Red oak	
Northern red oak	<i>Quercus rubra</i>
Black oak	<i>Quercus velutina</i>
Pin oak	<i>Quercus palustris</i>
White oak	
White oak	<i>Quercus alba</i>
Bur oak	<i>Quercus macrocarpa</i>
Chinkapin oak	<i>Quercus muehlenbergii</i>

Swamp white oak	<i>Quercus bicolor</i>
Black walnut	<i>Juglans nigra</i>
Yellow-poplar	<i>Liriodendron tulipifera</i>
Other hardwoods	
Honeylocust	<i>Gleditsia triacanthos</i>
Black locust	<i>Robinia pseudoacacia</i>
Black willow	<i>Salix nigra</i>
Boxelder	<i>Acer negundo</i>
Black cherry	<i>Prunus serotina</i>
Sycamore	<i>Platanus occidentalis</i>
Mulberry	<i>Morus</i> spp.
Noncommercial	
Apple	<i>Malus</i> spp.
Plum	<i>Prunus</i> spp.
Pear	<i>Pyrus</i> spp.
Ironwood	<i>Ostrya virginiana</i>
Russian olive	<i>Elaeagnus angustifolia</i>
Dogwood	<i>Cornus</i> spp.

1/ Standard cords are 128 cubic feet consisting of 79 cubic feet of wood and 49 cubic feet of bark and air space.

2/ May include substantial quantities of noncommercial cherry species.

Smith, W. Brad; Weatherspoon, Anthony.

1990. **Production and sources of residential fuelwood from roundwood in Michigan.** Resour. Bull. NC-122. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 76 p.

Discusses and analyzes 1986 fuelwood production from roundwood in Michigan. Analyzes production by geographic area, type of producer, species, landowner class, type of land, and tree source.

KEY WORDS: Growing stock, households, commercial producer, private land.
