FOREWORD

In this bulletin we discuss recent Minnesota forest industry trends and report the results of a detailed study of forest industry, industrial roundwood production, and associated primary mill wood and bark residue in Minnesota in 1988. Such detailed information is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, and forest industry development. Likewise, researchers need current forest industry and industrial roundwood information for planning projects.

Special thanks are given to the primary wood-using firms that supplied information for this study and to the Minnesota Department of Natural Resources for their diligent efforts in data collection and followup. Their cooperation is greatly appreciated.

All board foot data in this report have been converted to International 1/4-inch scale by applying a multiplier of 1.08 to all saw log volume reported in Scribner Decimal C scale by sawmills, a multiplier of 1.04 to all veneer log volume reported in Scribner Decimal C scale by veneer mills, a multiplier of 1.38 to all saw log volume reported in Doyle scale by sawmills, and a multiplier of 1.14 to all veneer log volume reported in Doyle scale by veneer mills.

The last published Forest Service report from a detailed study of all industrial roundwood output in Minnesota came out in 1975. Most comparisons in this report are with the 1975 study results.

Minnesota Timber Industry—An Assessment of Timber Product Output and Use, 1988

W. Brad Smith and Rick Dahlman

HIGHLIGHTS

PRIMARY TIMBER INDUSTRY—INDUSTRIAL ROUNDWOOD

- Industrial roundwood production rose from 156.4 million cubic feet in 1975 to 223.8 million cubic feet in 1988. Annual production increases averaged 6 percent for hardwoods, but softwood production showed no significant gains.
- Pulpwood accounted for 70 percent of all industrial roundwood production in 1988.
- Aspen supplied 61 percent of the total growing-stock harvest in 1988.
- Log and bolt receipts at active mills were 218.5 million cubic feet. Hardwood receipts rose 96 percent and softwood receipts rose 46 percent since 1975.

W. Brad Smith, Principal Mensurationist, received a B.S. degree in forestry in 1975 and an M.S. degree in forest management in 1977 from Purdue University. He joined the Forest Service in May 1977, and has been working with North Central's Forest Inventory and Analysis Unit since October 1977.

Rick Dahlman is a Marketing and Utilization Specialist with the Minnesota Department of Natural Resources, Division of Forestry. He received a B.S. degree in forest resources from the University of Minnesota and is working toward a masters degree in forest ecology. He joined the DNR in 1979 after working in private industry.

- Total material harvested from timberland for industrial roundwood (excluding residential fuelwood) was 327.7 million cubic feet. Growing stock accounted for 69 percent (225.5 million cubic feet) of this total. As a result of logging operations, 103.9 million cubic feet of sound material was left in the woods in 1988. This residual material included tops, limbs, growing-stock residues, and cull material.

In terms of volume of wood used, pulp mills dominate Minnesota forest industry; but sawmills far outnumber any other mill category. There were 724 mills of all types operating in Minnesota in 1988. Sixty-one percent of these mills were in the Aspen-Birch and Northern Pine Forest Survey Units. The Forest Survey Units of Minnesota are shown in figure 1.

PULPWOOD

- Minnesota produced a near record high 2.13 million cords of pulpwood (including residues) in 1988. This volume was only 1 percent lower than the record high of 2.15 million cords in 1984. Pulpwood comprises all fiber based products made from roundwood including particleboard, oriented strand board (OSB), and waferboard.
- Aspen constituted 70 percent of the roundwood cut for pulpwood. The introduction of waferboard and OSB, along with new and expanded paper mills, has further increased the dominant position of aspen for pulpwood in Minnesota (fig. 2). Since 1982 aspen pulpwood production increased 73 percent while total production increased 44 percent.

Figure 1.—Forest Survey Units in Minnesota.

Figure 2.—Pulpwood production of aspen and all species in Minnesota for selected years.

- Annual production of aspen, the leading pulpwood species, has increased nearly five-fold during the last 30 years with production of 0.32 million cords in 1958 and 1.50 million cords in 1988.
- Minnesota pulp mills have traditionally procured most of their wood requirements from within the State. This remains true, only small amounts of balsam fir and aspen roundwood and softwood mill residues were imported from Wisconsin.
- Exports of pulpwood to other States are minimal as well with 94 out of every 100 cords of Minnesota pulpwood cut in 1988 remaining in the State.

SAW LOGS

- Loggers delivered 307 million board feet of saw logs to saw mills in 1988, up 151 million board feet (97 percent) from 1975.
- Principal saw log species harvested were aspen (82 million board feet), red oak (47 million board feet), and pine (51 million board feet). White birch, red pine, aspen,

ash, basswood, soft maple, and walnut saw log production has more than doubled since 1975.

- Major production gains since 1975 were in aspen (33 million board feet), red oak (33 million board feet), and red pine (32 million board feet) (fig. 3). White birch, basswood, white pine, jack pine, white oak, and ash all showed production gains of more than 5 million board feet. Declines since 1975 occurred in cedar, elm, and balsam poplar.
- Six percent of the Minnesota saw log production was exported in 1988. Primary hardwood exports were red and white oak shipped to Wisconsin and Iowa, while softwood exports consisted mainly of spruce and pine headed for Canada.

Figure 3.—Saw log production for selected species groups in Minnesota, 1988.

- Leading saw log producing counties (with more than 20 million board feet each) were Itasca, St. Louis, Koochiching, Cass, and Beltrami. Three other counties (Aitkin, Houston, and Cook) each cut more than 10 million board feet.
- Six counties in southeastern Minnesota produced 72 percent (26 million board feet) of the red oak saw log volume in 1988 (fig. 4).
- In 1988, 673 active (operating) sawmills received 306 million board feet of saw logs; in 1975, 620 sawmills received 153 million board feet.
- Minnesota imported a total of 16 million board feet of saw logs primarily from Wisconsin and Iowa. Major species imported as saw logs were red and jack pine from Wisconsin and red oak from Iowa.

VENEER LOGS

The veneer log figures contained in this report reflect only those logs that were received and processed by mills in the U.S. or Canada and **do**

not include logs exported overseas. In recent years the volume of overseas exports has risen dramatically. Foreign export data indicate that more than 100 exporters shipped more than 150 million board feet of hardwood logs overseas in 1988. Many of these logs came from forests in the North Central Region. Although it is difficult to determine the volume that came from any particular State in this region, it is certain that the impact is significant and that the volume exported may be greater than domestic veneer production. Future studies will attempt to quantify the volume of logs exported overseas from States in the North Central Region.

- Loggers delivered 16.2 million board feet of veneer logs to veneer mills in 1988. Seventy-two percent of this volume remained in Minnesota, 18 percent was shipped to Michigan, and the remainder was sent to other States or Canada (fig. 4).
- White birch was the primary veneer species cut in Minnesota, followed by aspen and red oak. Basswood and red oak were the chief exports from Minnesota.

Figure 4.—Red oak saw log production in Minnesota in 1988.

OTHER PRODUCTS

- Other industrial roundwood products totalling 7.4 million cubic feet (3 percent of all industrial roundwood) were cut in Minnesota in 1988 (fig. 5). These products include commercial posts and poles, industrial fuelwood, shaving bolts, and excelsior bolts.
- Commercially produced posts (numbering 3.2 million) constituted 35 percent of the products in the "other" category; cedar was the leading post species. Eighty-two percent of the post volume was cut in the Northern Pine Survey Unit.

Residential fuelwood is a major nonindustrial product in Minnesota. The results of a 1988 residential fuelwood study are the subject of a separate Station publication.

TIMBER REMOVALS

- Timber removals from growing stock on timberland for industrial roundwood was 225.5 million cubic feet in 1988.

Figure 5.—Distribution of miscellaneous products in Minnesota in 1988.

Figure 6.—Distribution of material harvested from timberland for industrial roundwood in Minnesota, 1988.

- Total material harvested for roundwood products (excluding residential fuelwood) from timberland was 327.7 million cubic feet. Thirty-two percent (103.9 million cubic feet) of this total was left in the woods as logging residue (fig. 6). Residue material included tops, limbs, cull material, and growing-stock material not used for products.
- Major species harvested in both growing stock and sawtimber were aspen, pine, and oak.

LOGGING RESIDUE

- During 1988 loggers in Minnesota generated an estimated 103.9 million cubic feet of logging residue. Logging residue includes all sound growing-stock and nongrowing-stock wood fiber left behind from trees cut or killed during logging operations and not subsequently used for products. Of the total residues, 15.0 million cubic feet were growing-stock material and 88.9 million cubic feet were nongrowing-stock material.

- Aspen accounted for 57 percent of all logging residues.
- Five counties—St. Louis, Itasca, Koochi-ching, Cass, and Beltrami—each produced more than 5 million cubic feet of logging residue. Five central and southern counties—Houston, Pine, Wabasha, Mille Lacs, and Winona—which are high oak production counties each had more than 1 million cubic feet of residues.
- During 1988, Minnesota primary wood-using mills (except the pulp, particleboard, and waferboard mills) generated 419 thousand green tons of coarse residue, 254 thousand green tons of fine residue, and 190 thousand green tons of bark.
- Eighty-four percent of all coarse residues were used. Pulp mills consumed 42 percent (177 thousand tons) of all coarse mill residues for fiber products, and industry and households consumed 35 percent (147 thousand tons) for fuel.

PRIMARY MILL RESIDUE

- Sixty-five percent or more of each residue class (coarse, fine, bark) generated at Minnesota primary mills was used.
- Forty-five percent of all fine residues (115 thousand green tons) and 49 percent of all bark (92 thousand green tons) were used for industrial fuel.

APPENDIX

STUDY METHODS

Data for this publication came from responses to a mail questionnaire (see following pages) sent to all known veneer mills, specialty mills (poles, piling, etc.), and all Minnesota primary sawmills that processed more than 100 thousand board feet of logs and bolts in 1988. Sawmills processing less than 100 thousand board feet were contacted to verify ongoing operations, and data from a 1985 MDNR study were duplicated to reduce the data collection workload. The latter mills constituted less than 10 percent of the total production. The impact of this procedure on sampling error is considered negligible.

The study was a cooperative effort of the Minnesota Department of Natural Resources (MDNR) and the North Central Forest Experiment Station (NCFES). All canvassing in Minnesota (except of pulp mills) was done by the MDNR, using mail and personal contact; followup of

nonrespondents was by mail, telephone, and personal contact. MDNR utilization and marketing specialists provided estimates for a few Minnesota mills that did not furnish complete data, based on prior knowledge and contacts.

The NCFES mailed a questionnaire to all pulp mills and all out-of-State mills using Minnesota roundwood. Followup of nonrespondents was by mail and telephone.

Logging utilization factors were used to estimate growing-stock and sawtimber removals and the volume of logging residue generated during harvesting operations. These factors were determined for saw logs and pulpwood from the 1989-1990 Minnesota Logging Utilization Study conducted as part of the new Minnesota forest inventory by NCFES. Utilization factors for other products were established during earlier studies in the Lake States.

The NCFES edited and compiled the data.

LOGS AND OTHER WOOD PROCESSED IN 1988

MINNESOTA

This form is for reporting the quantities and kinds of logs and other wood processed by this plant in 1988, and the disposition of the wood residues resulting from this operation.

DEFINITION OF TERMS

Coarse mill residue.—Wood residue suitable for chipping such as slabs, edging, and veneer cores.

Consumption.—The quantity of a commodity, such as saw logs, utilized.

Fine mill residue.—Wood residue not suitable for chipping such as sawdust and veneer clippings.

Forest industry land.—Land owned by companies or individuals operating primary wood-using mills.

Forest Survey Unit.—A geographic area (group of counties) used by the Forest Inventory and Analysis Project to report periodic inventories and use of forest resources.

Industrial roundwood products.—Saw logs, pulpwood, veneer logs, poles, commercial posts, piling, cooperage logs, particleboard bolts, shaving bolts, lath bolts, charcoal bolts, and chips from roundwood used for pulp or board products.

Industrial roundwood production.—The quantity of industrial roundwood harvested in a geographic area.

Industrial roundwood receipts.—The quantity of industrial roundwood received by commercial mills in a geographic area regardless of the geographic source.

Logging residue.—The unused portions of trees cut or killed by logging.

National Forest land.—Federal land that has been legally designated as National Forest or purchase units, and other land under the administration of the USDA Forest Service.

Particleboard.—Panel product produced by compressing and bonding small particles of wood. Includes panels made from shavings, flakes, wafers, chips, sawdust, strands, slivers, or wood wool.

Primary wood-using mills.—Mills receiving roundwood or chips from roundwood for processing into products.

Primary wood-using mill residue.—Wood materials (coarse and fine) and bark generated at manufacturing plants from roundwood processed into principal products. These residues include wood products (by-products) obtained incidental to production of principal products and wood materials not utilized for some product.

Roundwood.—Logs, bolts, or other round sections cut from trees (including chips from roundwood).

Standard cord.—A stack of wood bolts (or the equivalent) encompassing 128 cubic feet of wood, bark, and air space. A cord of pulpwood in the North Central Region is assumed to contain 79 cubic feet of wood and 49 cubic feet of bark and air space. Most industries in Minnesota report cordwood volume in 100-inch cords or Lake States cords. These data are converted to 96-inch standard cord equivalents for this report.

State land.—Land owned by States or land leased to these governmental units for 50 years or more.

Timberland.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization by statute or administrative regulation. Generally, this includes areas suitable for growing crops of industrial wood in excess of 20 cubic feet per acre annually.

1/ Suitable for chipping such as slabs, edgings, veneer cores, etc.

2/ Not suitable for chipping such as sawdust, veneer clippings, etc.

3/ Livestock bedding, mulch, small dimension, and specialty items.

Smith, W. Brad; Dahlman, Rick.

1991. **Minnesota timber industry—an assessment of timber product output and use, 1988.** Resour. Bull. NC-127. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 61 p.

Discusses recent Minnesota forest industry trends; production and receipts of pulpwood, saw logs and veneer logs; and production of other timber products in 1988. Reports on logging residue, wood and bark residue generated at primary wood-using mills, and disposition of mill residues.

KEY WORDS: Pulpwood, saw logs, veneer logs, residue
