Minnesota Timber Industry—An Assessment of Timber Product Output and Use, 1990

Ronald L. Hackett and Richard A. Dahlman

ACKNOWLEDGMENT

We thank the following Minnesota Department of Natural Resources personnel who canvassed mills in the State of Minnesota:

Minnesota Department of Natural Resources Utilization & Marketing Program

John Kranz, Program Supervisor
Rick Dahlman, Program Specialist
Jeff Edmonds, Northwest Region Specialist
Carl Prosek, Northeast Region Specialist
Paul Peterson, Central Region Specialist
Phil Vieth, Southern Region Specialist

FOREWORD

In this bulletin we discuss recent Minnesota forest industry trends and report the results of a detailed study of forest industry, industrial roundwood production, and associated primary mill wood and bark residue in Minnesota in 1990. Such detailed information is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, and forest industry development. Likewise, researchers need current forest industry and industrial roundwood information for planning projects.

Special thanks are given to the primary wood-using firms that supplied information for this study and to the Minnesota Department of Natural Resources personnel for their diligent efforts in data collection and followup. Their cooperation is greatly appreciated.

All board foot data in this report have been converted to International 1/4-inch scale by applying a multiplier of 1.08 to all saw-log volume reported in Scribner Decimal C scale by sawmills, a multiplier of 1.04 to all veneer log volume reported in Scribner Decimal C scale by veneer mills, a multiplier of 1.38 to all saw-log volume reported in Doyle scale by sawmills, and a multiplier of 1.14 to all veneer log volume reported in Doyle scale by veneer mills.

The last Forest Service report from a detailed study of all industrial roundwood output in Minnesota was published in 1988. Most comparisons in this report are with the 1988 study results.

Minnesota Timber Industry—An Assessment of Timber Product Output and Use, 1990

Ronald L. Hackett and Richard A. Dahlman

HIGHLIGHTS

PRIMARY TIMBER INDUSTRY—INDUSTRIAL ROUNDWOOD

- Industrial roundwood production (harvest) increased from 223.8 million cubic feet in 1988 to 234.4 million cubic feet in 1990. Annual production of hardwoods increased an average of 7 percent, but softwood production declined an average of 3 percent.
- Pulpwood accounted for 76 percent of all industrial roundwood production in 1990.
- Industrial roundwood receipts (received) at active mills were 234.3 million cubic feet. Hardwood receipts increased 9 percent and softwood receipts increased 3 percent since 1988.
- To produce the 1990 volume of industrial roundwood (excluding residential fuelwood), 342.7 million cubic feet of total wood material was harvested from Minnesota timberlands. Sixty-nine percent of

this total was harvested from growing-stock material; 108.3 million cubic feet of this material was left in the woods as harvest residues. This residual material included tops, limbs, growing-stock residues (pieces of merchantable log), and cull material.

- Aspen supplied 64 percent of the total growing stock harvested in 1990.

In terms of volume of wood used, pulp mills dominate Minnesota's forest industry; but sawmills far outnumber any other mill category. There were 572 mills of all types operating in Minnesota in 1990. Sixty-one percent of these mills were in the Aspen-Birch and Northern Pine Forest Survey Units. The Forest Survey Units of Minnesota are shown in figure 1.

PULPWOOD

- Minnesota produced a record high of 2.35 million cords of pulpwood (including residues) in 1990. Pulpwood comprises all fiber-based products made from roundwood and residues used in the manufacture of paper, particleboard (see Definition of terms), oriented strand board (OSB), and waferboard.
- Aspen constituted 73 percent of the roundwood pulpwood cut. New and expanding OSB and paper mills have further increased the dominant position of aspen in Minnesota (fig. 2).
- Production of the leading pulpwood species, aspen, has increased 10 percent (157 thousand cords) from 1988.
- Minnesota pulp mills have procured most—96 percent—of their wood requirements from within the State. Wisconsin

Ronald L. Hackett, Research Forester, received a B.S. in forest resources from the University of Minnesota. He joined the Forest Service in December 1974 and has been working with the North Central Station's Forest Inventory and Analysis Unit since.

Richard A. Dahlman is a Marketing and Utilization Specialist with the Minnesota Department of Natural Resources, Division of Forestry. He received a B.S. in forest resources and an M.S. in forest ecology from the University of Minnesota. He joined the DNR in 1979 after working in private industry.

Figure 2.— Roundwood pulpwood production of aspen and all other species in Minnesota for selected years.

provides 3.6 percent (83 thousand cords) of mostly aspen, balsam fir, and spruce for pulpwood use.

- Pulpwood exports to other States are minimal. Ninety-three percent of pulpwood cut in Minnesota in 1990 remained in the State.

Pulpwood production is a major industrial product in Minnesota. Surveys of pulpwood mills are done yearly. For more information and data on pulpwood production in Minnesota and the North Central Region, see "Pulpwood production in the north-central region, 1990."

SAW LOGS

- In 1990, 264.6 million board feet of saw logs were harvested in Minnesota—a decrease of 42.4 million board feet (14 percent) from 1988.
- Principal saw-log species harvested were aspen (83 million board feet), red oak (42 million board feet), and pine (69 million board feet).

- Major production gains since 1988 were in white birch (4 million board feet), basswood (379 thousand board feet), and aspen (312 thousand board feet) (fig. 3). Major declines since 1988 occurred in jack pine, red pine, white pine, red oak, and elm. The decline in pine production was mainly due to the shut down of a major mill for part of the year as it was relocated.

Figure 3.— Saw-log production by selected species in Minnesota, 1988 and 1990.

- Four percent of the Minnesota saw-log production was exported in 1990. Primary hardwood exports were red oak to Wisconsin and basswood to Iowa. Softwood exports consisted mainly of jack and red pine, balsam fir, and spruce headed for States outside the region.
- Leading saw-log producing counties (more than 20 million board feet) were Itasca, Koochiching, Cass, and St. Louis.
- Five counties in southeastern Minnesota produced 48 percent (20 million board feet) of the red oak saw-log volume in 1990. They were Fillmore, Houston, Goodhue, Wabasha, and Winona Counties.

- Minnesota imported a total of 4.9 million board feet of saw logs primarily from Wisconsin and Iowa. Major species imported as saw logs were red and jack pine from Wisconsin and red oak from Iowa.

VENEER LOGS

- Loggers cut 16.7 million board feet of veneer logs in 1990, up 3 percent from 1988. Of the veneer log and bolt volume, 63 percent remained in Minnesota, 10 percent was shipped to Wisconsin, and the remainder was sent to other States and Canada.
- White birch was the primary species cut for veneer logs and bolts in Minnesota in 1990, followed by basswood, aspen, and ash. Basswood and ash were the main veneer log and bolt exports from Minnesota.
- In 1990, 4.1 million board feet of veneer logs and bolts from Minnesota was sent overseas to the Pacific Rim and European countries. The major species exported overseas were basswood (1.9 million board feet), ash (1.2 million board feet), oaks (0.6 million board feet), and walnut (0.3 million board feet).
- White birch and aspen were the only species reported as undergoing secondary processing in Minnesota in 1990.

OTHER PRODUCTS

- Other industrial roundwood products totalling 5.3 million cubic feet (2 percent of all industrial roundwood) were cut in Minnesota in 1990 (fig. 4). These other products include roundwood harvested for commercial posts and poles, industrial fuelwood, shaving bolts, and excelsior bolts.
- Industrial fuelwood—roundwood harvested from timberland and used to fuel boilers for heat and/or electrical generation—production in Minnesota was 683

Figure 4.— Distribution of other products in Minnesota in 1990.

thousand cubic feet or 13 percent of the other products category. White birch was the major species cut for industrial fuelwood with 5,750 cords or 56 percent of the industrial fuelwood harvested in 1990.

- Miscellaneous products—shavings and excelsior—constituted 70 percent of the other products category; aspen was the leading species of miscellaneous products.

Residential fuelwood is a major nonindustrial product in Minnesota. The results of a 1990 residential fuelwood study are the subject of a separate Station publication, "Residential fuelwood production and sources from roundwood in Minnesota, 1988."

TIMBER REMOVALS

- In the production of Minnesota's 1990 industrial roundwood harvest, 236 million cubic feet of growing stock was removed from timberlands, a 5-percent increase since 1988.
- Total amount of material harvested for roundwood products (excluding residential fuelwood) from timberland was 342.7

Figure 5.— *Distribution of material harvested from timberland for industrial roundwood in Minnesota, 1990.*

million cubic feet. Thirty-two percent (108.3 million cubic feet) of this total was left in the woods as logging residue (fig. 5). Residue material included tops, limbs, cull material, and growing-stock material not used for products.

- Major species harvested from both growing stock and sawtimber were aspen, pine, and oak.

HARVEST RESIDUE

- In 1990, loggers in Minnesota left an estimated 108.3 million cubic feet of unused wood material on harvested timberlands. Of this, 14.9 million cubic feet was growing-stock material and 93.4 million cubic feet was nongrowing-stock material.
- Aspen accounted for 60 percent of all harvest residues in 1990.
- Loggers in the Northern Pine Unit produced 50 percent of the harvest residue in Minnesota. Itasca County reported

17.6 million cubic feet of harvest residue, second only to St. Louis County with 19.2 million cubic feet in 1990.

PRIMARY MILL RESIDUE

- Seventy-five percent of the total residue generated at Minnesota primary mills was used.
- Minnesota primary wood-using mills (except the pulp, particleboard, and waferboard mills) generated 356 thousand green tons of coarse residue, 218 thousand green tons of fine residue, and 1,054 thousand green tons of bark in 1990.
- Eighty-three percent of all coarse residues were used. Pulp mills consumed 44 percent (155 thousand tons) of all coarse mill residues for fiber products, and industry and households consumed 33 percent (118 thousand tons) for fuel.
- Twenty-six percent of all fine residues (95 thousand tons) and 90 percent (947 thousand tons) of bark were used for industrial fuelwood.

APPENDIX

STUDY METHODS

Data for this publication came from responses to a mail questionnaire (see following pages) sent to all known veneer mills, specialty mills (poles, piling, etc.), and all Minnesota primary sawmills that processed more than 100 thousand board feet of logs and bolts in 1990. Sawmills processing less than 100 thousand board feet were contacted to verify ongoing operations. Data from a 1985 Minnesota Department of Natural Resources study of those mills were duplicated to reduce the data collection workload. Because these mills contributed less than 10 percent of the total production, the impact of this procedure on sampling error is considered negligible.

The study was a cooperative effort of the Minnesota Department of Natural Resources (MDNR) and the North Central Forest Experiment Station (NCFES). All canvassing in Minnesota (except pulp mills) was done by the MDNR using mail and personal contact; followup of nonrespondents was by mail,

telephone, and personal contact. MDNR utilization and marketing specialists provided estimates based on prior knowledge and contacts for a few Minnesota mills that did not furnish complete data.

The NCFES mailed a questionnaire to all pulp mills and all out-of-State mills that use Minnesota roundwood. Followup of nonrespondents was by mail and telephone.

Logging utilization factors were used to estimate growing-stock and sawtimber removals and the volume of logging residue generated during harvesting operations. These factors were determined for saw logs and pulpwood from the 1989-1990 Minnesota Logging Utilization Study conducted as part of the new Minnesota forest inventory by NCFES. Utilization factors for other products were established during earlier studies in the Lake States.

The NCFES edited and compiled the data.

DEFINITION OF TERMS

Coarse mill residue.—Wood residue suitable for chipping such as slabs, edging, and veneer cores.

Fine mill residue.—Wood residue not suitable for chipping such as sawdust and veneer clippings.

Forest Survey Unit.—A geographic area (group of counties) used by the Forest Inventory and Analysis Project to report periodic inventories and use of forest resources.

Harvest residues.—The total unused wood material left after harvesting.

Industrial roundwood products.—Saw logs, pulpwood, veneer logs, poles, commercial posts, piling, cooperage logs, particleboard bolts, shaving bolts, lath bolts, charcoal bolts, and chips from roundwood used for pulp or board products.

Industrial roundwood production.—The quantity of industrial roundwood harvested in a geographic area.

Industrial roundwood receipts.—The quantity of industrial roundwood received by commercial mills.

Logging residue.—The unused portions of the merchantable section of growing-stock trees cut or killed by logging.

Logging slash.—The unused portion of an unmerchantable section of tree cut or killed by logging.

Particleboard.—A generic term for a panel manufactured from lignocellulosic materials—commonly wood—essentially in the form of particles produced by compressing

and bonding small particles of wood. Includes panels made from shavings, flakes, wafers, chips, sawdust, strands, slivers, or wood wool.

Primary wood-using mills.—Mills receiving roundwood or chips from roundwood for processing into products.

Primary wood-using mill residue.—Wood materials (coarse and fine) and bark generated at manufacturing plants from roundwood processed into principal products. These residues include wood products (byproducts) obtained incidental to production of principal products and wood materials not utilized for some product.

Roundwood.—Logs, bolts, or other round sections cut from trees (including chips from roundwood).

Standard cord.—A stack of wood bolts (or the equivalent) encompassing 128 cubic feet of wood, bark, and air space. A cord of pulpwood in the North Central Region is assumed to contain 79 cubic feet of wood and 49 cubic feet of bark and air space. Most industries in Minnesota report cordwood volume in 100-inch cords or Lake States cords. These data are converted to 96-inch standard cord equivalents for this report.

Timberland.—Forest land producing, or capable of producing, crops of industrial wood and not withdrawn from timber utilization by statute or administrative regulation. Generally, this includes areas suitable for growing crops of industrial wood in excess of 20 cubic feet per acre annually.

Veneer log.—A log considered suitable in size and quality for producing veneer-sliced or rotary-cut.

TREE SPECIES MENTIONED IN THIS
REPORT**

SOFTWOODS

Jack pine	<i>Pinus banksiana</i>
Red pine	<i>Pinus resinosa</i>
Eastern white pine	<i>Pinus strobus</i>
Spruce	
White spruce	<i>Picea glauca</i>
Black spruce	<i>Picea mariana</i>
Balsam fir	<i>Abies balsamea</i>
Tamarack	<i>Larix laricina</i>
Northern white-cedar	<i>Thuja occidentalis</i>
Other softwoods	
Eastern redcedar	<i>Juniperis virginiana</i>
Scotch pine	<i>Pinus sylvestris</i>

HARDWOODS

White oak	
White oak	<i>Quercus alba</i>
Bur oak	<i>Quercus macrocarpa</i>
Swamp white oak	<i>Quercus bicolor</i>
Red oak	
Northern red oak	<i>Quercus rubra</i>
Black oak	<i>Quercus velutina</i>
Northern pin oak	<i>Quercus ellipsoidalis</i>
Hickory	
Bitternut hickory	<i>Carya cordiformis</i>
Shagbark hickory	<i>Carya ovata</i>
White birch	<i>Betula papyrifera</i>
Yellow birch	<i>Betula alleghaniensis</i>
Hard maple	
Black maple	<i>Acer nigrum</i>
Sugar maple	<i>Acer saccharum</i>
Soft maple	
Red maple	<i>Acer rubrum</i>
Silver maple	<i>Acer saccharinum</i>
Ash	
Black ash	<i>Fraxinus nigra</i>
White ash	<i>Fraxinus americana</i>
Green ash	<i>Fraxinus pennsylvanica</i>
Balsam poplar	<i>Populus balsamifera</i>
Aspen	
Bigtooth aspen	<i>Populus grandidentata</i>
Quaking aspen	<i>Populus tremuloides</i>
Eastern cottonwood	<i>Populus deltoides</i>
American basswood	<i>Tilia americana</i>
Black walnut	<i>Juglans nigra</i>
Elm	
American elm	<i>Ulmus americana</i>
Rock elm	<i>Ulmus thomasii</i>
Slippery elm	<i>Ulmus rubra</i>

Other hardwoods

Black cherry	<i>Prunus serotina</i>
River birch	<i>Betula nigra</i>
Butternut	<i>Juglans cinerea</i>
Black willow	<i>Salix nigra</i>
Boxelder	<i>Acer negundo</i>
Hackberry	<i>Celtis occidentalis</i>
Kentucky coffeetree ...	<i>Gymnocladus dioica</i>

1/ Factors for determining thousand cubic feet (MCF) are based on Minnesota Utilization Study, 1990

2/ Thousand board feet, International 1/4-inch rule.

3/ Thousand cubic feet.

4/ Standard cords are 128 cubic feet consisting of 79 cubic feet of wood and 49 cubic feet of bark and air space.

Table 4.-- Material harvested on timberland for industrial roundwood production by source of material and species group, Minnesota, 1990 1/

(In thousand cubic feet)

1/ Suitable for chipping such as slabs, edgings, veneer cores, etc.

2/ Not suitable for chipping such as sawdust, veneer clippings, etc.

3/ Livestock bedding, mulch, small dimension, and specialty items.

The policy of the United States Department of Agriculture Forest Service prohibits discrimination on the basis of race, color, national origin, age, religion, sex, or disability. Persons believing they have been discriminated against in any Forest Service related activity should write to: Chief, Forest Service, USDA, Washington, DC 20250.

Hackett, Ronald L.; Dahlman, Richard A.

1993. Minnesota timber industry—an assessment of timber product output and use, 1990. Resour. Bull. NC-143. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 52 p.

Discusses recent Minnesota forest industry trends; production and receipts of pulpwood, saw logs, and veneer logs; and production of other timber products in 1990. Reports on logging residue, wood and bark residue generated at primary wood-using mills, and disposition of mill residues.

KEY WORDS: Pulpwood, saw logs, veneer logs, residue
