SUMMARY

A compendium of more than 400 citations of literature published between 1979 and 1990 on wildlife habitat, range, recreation, hydrology, and related research is presented. This review is restricted to studies that use the extensive-area sample design and data from the U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis units for the continental United States. A brief list of selected studies between 1974 and 1978 is included for historical importance. The list for the principal subjects—wildlife habitat, range, recreation, and hydrology—is designed to be comprehensive for the period from 1979 to 1990.

Citations of related research topics are included, specifically those from noncommercial wood resources (i.e., woodlands, fencerows, shrubs, and noncommercial trees), field sampling techniques, herbaceous biomass, insect and disease studies, forest landowner surveys, satellite image interpretation, inventory sampling design, and classification of land area by vegetation and land uses. Such topics often touch on hydrologic, range, wildlife habitat, or recreation resource values of forests. Rather than a comprehensive list for related topics, citations have been selected to represent the range of published reports. These citations are contained in a data base maintained by the Forest Inventory and Analysis unit in Starkville, Mississippi.

ACKNOWLEDGMENTS

Special thanks are accorded to Fran Hunt and Rudy Rosen of the National Wildlife Federation, Richard Rice of the Wilderness Society, and William Shands of the Conservation Foundation for the spark that led to the preparation of this document. Assistance from the following people is gratefully acknowledged: Richard Birdsey, Robert Brooks, Noel Cost, Curt Flather, Mark Hansen, Linda Joyce, Vernon "Jim" LaBau, H. Gyde Lund, Bert Mead, Renee O'Brien, and Douglas Powell of the Forest Service. My thanks to these and other scientists and clerical staff who helped in preparing the list of citations.

Wildlife Habitat, Range, Recreation, Hydrology, and Related Research Using Forest Inventory and Analysis Surveys: A 12-Year Compendium

Victor A. Rudis

INTRODUCTION

In 1984, the United States Department of Agriculture, Forest Service, Inventory Integration Workshop made a recommendation to

...keep current a list of nontimber vegetation inventory techniques used by Forest Inventory and Analysis (FIA) units. (Rudis 1984).

Researchers, planners, and natural resource managers from a variety of disciplines and agencies have expressed similar thoughts, which led to the creation of a bibliographic data base. The data base contains citations of scientific literature that draw upon forest surveys conducted by the U.S. Department of Agriculture, Forest Service, FIA units as a basis for analysis of wildlife habitat, range, recreation, hydrology, and related natural resources.

Compilation of the data base is one step in assessing data needs from an interdisciplinary perspective. Citations provide examples of the kinds of topics being addressed, the data and techniques available, and the uses to which they have been, or can be, put. The data base organizes information already available, provides a handy reference to examine past accomplishments, and can guide future efforts toward more fruitful investigation.

Because FIA surveys are the only source of detailed statistics on aboveground private forest resources for extensive areas, and because comparable data are gathered for public forests, they can be extremely valuable for regional planning in a wide variety of disciplines—not just those concerned with timber resources. Like everything else, the cost to conduct FIA surveys (approximately \$13 million in 1990 for seven FIA units nationwide) is increasing. Such public expenditures and the priorities attached to them require the support of informed and involved users.

Identifying and involving users and making the sampling design and the data meaningful and avail-

able to a diverse audience are necessary, yet daunting, tasks. The barrage of information in FIA reports easily can overwhelm the average planner, consultant, or researcher. Few individuals are likely to sift through the information in surveys or reports that are not directly addressed to their discipline or agency. Neither are they likely to define their needs in terms relevant to the forest resource data needs of other disciplines and agencies.

The following review, and the citations listed in the appendix, are a compendium of publications that focus on water, range, wildlife habitat, recreation, and related studies that use data from FIA surveys for the continental United States. The list of publications on these subjects is designed to be comprehensive for the period 1979 to 1990. Also included are citations selected for their historical importance for the period 1974 to 1978. Lund and McNutt (1979) provide an annotated list of citations prior to 1979.

REVIEW

History

The Forest Service is responsible for assessing conditions and trends in public and private forest resources. Since the 1930's, the Forest Service has promulgated FIA research work units to conduct these surveys on private land and non-federal public land. The FIA units also survey many of the smaller Federal land parcels, Federal land in Alaska, and all national forest land in the Eastern United States. FIA units coordinate with regional offices of the National Forest System, the Bureau of Land Management, and other landholding Federal agencies to ensure that information is compiled for all forest resources in the United States.

Early efforts by FIA units focused on measurement of commercial wood characteristics to assess timber

Victor A. Rudis is research forester, U.S. Department of Agriculture, Forest Service, Southern Forest Experiment Station, Starkville, MS 39759-0906.

supplies in terms of forested area and timber volume. Although a few studies in the 1950's and 1960's linked FIA forest surveys with other resources to quantify wildlife habitat (Barnes and Barnard 1979), most cross-disciplinary investigations were limited to descriptive geography on forest cover and land use changes. With growing concern for describing timber's availability and increased environmental awareness by the general public, the United States Congress broadened the scope of the survey effort with the passage of the Forest and Rangeland Renewable Resources Planning Act of 1974 (Public Law 93-378 [88 Stat. 476]) and the Forest and Rangeland Renewable Resources Research Act of 1978 (Public Law 95-307 [92 Stat. 353]). Under these laws, FIA units—along with other Federal agencies—were mandated to conduct a *comprehensive* assessment of forest resources.

In 1975, a meeting scheduled to discuss the 1976 survey of South Carolina was chosen as the time to launch a

... crash techniques development program to expand the ongoing timber-oriented forest survey into a more complete ... inventory. (McClure 1979). Initial findings appeared in "Multiresource Inventories—A New Concept for Forest Survey" (McClure and others 1979). In South Carolina and elsewhere, pioneering studies focused on appraisal of forestland grazing (Pearson and Sternitzke 1974, Sternitzke 1976, Sternitzke and Pearson 1974, 1975), recreation use (Saunders 1979), soils and hydrology (Dissmeyer 1979), vegetation structure (Cost 1979), and the multiple objectives of nonindustrial private landowners (Birch and Kingsley 1978; Birch and Powell 1978; Kingsley 1975, 1976; Kingsley and Birch 1977; Kingsley and Finley 1975).

Several wildlife habitat studies were initiated in the 1970's. These included an inventory of deer browse in Louisiana (Pearson and Sternitzke 1976), breeding habitat for woodpeckers in West Virginia (Barnes and Barnard 1979), red-cockaded woodpecker nesting habitat in the Southeastern United States (Lennartz and McClure 1979), and winter deer browse in southern New Hampshire forests (Barnes 1975). Other studies included simulation of wildlife habitat with changes in forest conditions (Boyce and Cost 1978) and estimation of trends in woodcock habitat (Cushwa and others 1977).

Along with, and subsequent to, these new initiatives, Forest Service scientists and cooperators at research institutions modified basic inventory procedures for FIA data collection and analysis and developed other techniques to address emerging issues. Basic forest resource characteristics expected to be reported or inventoried by each FIA unit were compiled in 1984 (LaBau 1984). Priorities attached to characteristics inventoried and the issues addressed

have shifted over the years. Nevertheless, the 1984 report documents FIA efforts to supply information not only on timber resources, but also on many of the associated components of forest ecosystems, including water, range, wildlife habitat, and recreation resources.

Many of the modifications and new techniques have been aided by reports of research applications from a variety of disciplines and by assessment reports concerned with multiresource inventories. Important guides to these documents have been published as bibliographies and conference proceedings. A valuable reference is an annotated bibliography of integrated inventory studies (Lund and McNutt 1979), as it compiles many citations for inventories conducted by other United States agencies and foreign countries. Most documents cited in the annotated bibliography were published between 1970 and 1978, in addition to a few historically important references of the 1960's.

Other helpful collected works include multiagency and multidiscipline conference proceedings on such topics as integrated inventories (Lund and others 1978), forest resource inventories (Frayer 1979), wildlife habitat inventories (Cushwa and Petoskey 1979), in-place resource inventories (Brann and others 1982), renewable resource inventories (Bell and Atterbury 1983), and global natural resource monitoring (Lund and Preto 1990). Forest Service workshop proceedings in inventory integration (Schlatterer and Lund 1984) and forest land inventories (Lund 1984) also have been invaluable.

More recently, studies have appeared in journals and conference proceedings associated with other disciplines. Many of these studies are annotated in the proceedings of a workshop entitled "Integrating Multiple Value Forest Surveys Into Timber Survey," held in Syracuse, New York, on August 2, 1989, as part of the state-of-the-art conference on forest inventory methodology (LaBau and Cunia 1990).

Data Collection and Dissemination

The sample designs used by each FIA unit vary slightly because each unit encounters different forest conditions, constituents in need of data, and priority issues to be addressed. In general, forest area is estimated by means of aerial photography and verified in the field at the ground level. Detailed observations are taken in the field on 0.5 acre to 8 acre plots that are distributed across the area being surveyed. In many cases, plots are permanent; most occur on private land. Field observations represent samples of the resource and are expanded statistically to assess forest conditions for entire counties, States, and regions.

Data are compiled by State and region every 6 to 12 years and published as Forest Service Experiment Station Resource Bulletins. National compilations are

reported periodically, most recently in 1989 (Haynes 1990, USDA FS 1977, 1980, 1989).

Typically, forest area, tree species, and timber volume are reported in summary form. The current status of the resource and the trends, if available, are noted in statistical documents that include graphs and standardized tables. Additional analyses are presented in State assessment reports. Further information is offered through specialized analytical studies in research journals, popular articles, and proceedings by FIA scientists and cooperators. (See USDA Forest Service 1987 for more details.)

Specialized field data collection efforts and access to detailed statistics have been part of FIA unit research activities for some time. The FIA units support such activities as part of cooperative funding arrangements with State and regional forestry agencies, universities, and other research institutions. More recently, online data bases and customized tables of frequently requested information have been made available at nominal cost to a wide variety of users, including planners, the forest industry and other natural resource consultants, and even private citizens.

Of particular interest to a wide audience are mapped FIA plot information (Beltz and Bertelson 1990, Kingsley 1985), geo-referenced data analyses (McWilliams and Faulkner 1990, Oswald 1988, Rudis 1986, Tosta and Marose 1987), an online data base for the Eastern United States, and customized tables for ownership and forest characteristics at the regional, county, plot, and tree level of resolution. Details on a data base for the Eastern United States are provided in Hahn and Hansen (1990), Hansen (1990), McWilliams (1990), and Sheffield (1990). Use of FIA data in a geographic information system, while nascent (Newton and Bower 1990), should prove helpful in regional planning, geography, and related disciplines in the near future.

The User Audience Dilemma

The major users for the data and analytical reports have been National, State, and county forestry agencies, forest industries, and forest industry consulting organizations. There is a continuing need to update the surveys and reports for use by timber companies, forestry consultants, State and Federal planners concerned with forest resource issues and an expressed need for *more, better, and faster* timber inventory data. To fathom what constitutes strategically important components of a *comprehensive* survey, information from—and involvement by—other agencies and disciplines are also needed.

Outside traditional State and regional forest resource interests, however, there is limited knowledge that periodic field surveys of forested areas are conducted in the United States. One problem may be that

FIA forest surveys are largely unpublished in the more general scientific literature (Abernethy and Turner 1987).

Unlike traditional users, wildlife, range, recreation, water, and timber (i.e., multiple-value) resource data users are not limited to a single discipline or agency. Even within the forestry profession, analytical studies on national multiple-forest resource trends (Flather and Hoekstra 1989, Joyce 1989, USDA FS 1989) are only beginning to receive wider attention (Rockwell 1990).

Recent State-level forest resource assessment reports (Bechtold and others 1990, Bolsinger 1980, Considine 1984, Kelly and Sims 1989, Spencer and others 1990, Van Hooser 1990) list multiple-value resources of forests. But much of the data, terminology, and analyses in these and similar reports at the county level of resolution reflect the needs of timber interests—the traditional audience for these reports.

Needs exist for timber and other forest resource information, and comprehensive assessments are mandated by law at the national level. However, the relative importance of these needs remains unresolved.

The range of data, analyses, and potential audience for multiple-value forest resource information—both outside and inside the Forest Service—is broad. Data dissemination and involvement across disciplines at the technical level and across agency jurisdictional boundaries at the administrative level are poorly coordinated. Partly as a result of this situation, priorities attached to the FIA survey effort by natural resource disciplines and agencies vary widely.

The need for timber resource information has been expressed in numerous publications (Irland Group 1989, Tarbet and Cashwell 1990, USDA FS 1987). User needs other than those expressed by timber interests, and progress in meeting those needs, are summarized in the following section.

Addressing Other User Needs

Studies by a few technical experts outside timber resource interests and outside the Forest Service have documented the utility of FIA data at the regional level. These studies include the analysis of aesthetics (Buhyoff and others 1986), air pollution (Guenther and others 1989), climate and tree distribution patterns (Denton and Barnes 1987), forest pests (Jacobi and others 1981), forest soils (David and others 1988, 1989), forested wetlands (Abernethy and Turner 1987, Langdon and others 1981, Turner and others 1981), landowner social psychology (Fortmann 1990), land use (Clawson 1979; Healy 1984, 1985; Klopatek and others 1979; Olson and others 1983), recreation potential and use (Johnson and others 1988, Saunders 1979, 1981, Saunders and others 1979), regional ecosystem

ranking (Klopatek and others 1981), snag and den inventories (McComb and others 1986a, 1986b), status of individual tree species (Ward 1989), and vegetation structure (Hamel and others 1986).

FIA data also have been used as ground-based estimates of forest condition to help classify vegetative cover from satellite images (Cook and others 1989, Iverson and Risser 1987, Iverson and others 1989, 1990).

Users outside the Forest Service (Barnard and others 1985, Chalk and others 1984, Hirsch and others 1979, Hunt 1990, Irland Group 1989, Lewis 1988, Porter and others 1983, Rice 1990, Shands 1985) have documented the need for selected data and analyses from FIA units. Needs also are expressed, though not documented fully, in data requests made to individual FIA units. Selected stand characteristics and species information obtained from FIA surveys on private land, and on national forest land in the Eastern United States, have been of particular interest to State natural heritage agencies, wildlife agencies, and conservation groups.

Within the Forest Service, there has been periodic interest at the national level for incorporating interdisciplinary data collection and analysis efforts with FIA surveys (Barnard 1990, Barnard and others 1985, Bones 1990, Hoekstra and Flather 1986, Hoekstra and others, 1979, Kaiser 1987, LaBau and Schreuder 1983, Schlatterer and Lund 1984, Wikstrom and Hoekstra 1981). At the regional level, studies have noted the importance in including assessments of aesthetics (Rudis 1983, Rudis and others 1988), biodiversity (Ohmann and Bolsinger, *in press*), and forest characteristics, including edges (Brooks and Scott 1983, LaBau and others 1986), health (Cost 1990a, Hornbeck and Smith 1985), nongame bird habitat (Brooks 1990b, Brooks and Porter 1983, Lennartz and others 1983, Sheffield 1981), insect and disease damage (Anderson and others 1986, 1988, May and Kauffman 1990), soils (Dissmeyer and Cost 1984, Grigal and Ohmann 1989, van Hees 1988), stand type changes by landowner (Alig and Wyant 1985), understory disturbances (Joyce and Baker 1987, Rudis and Skinner 1990), and vegetative structure (Cost 1984, O'Brien and Van Hooser 1983, Rudis 1990b).

Many FIA-related studies focus on resource characteristics measured on timberland. Some studies do incorporate data from nontimberland areas, nonforest resources, and from user groups associated with forest resources. Among these are comparisons with data on animal populations (Flather and others 1989; Flebbe and others 1988), atmospheric deposition (Ohmann and Shifley 1989), land development (Gedney and Hiserote 1989), landowners (Birch 1983), land use change (Birch and Wharton 1982), nonindustrial wood resources (Born 1990, Castonguay and Hansen 1984, Collins 1989), nontree biomass (Cost and others 1990,

Joyce and Mitchell 1989), recreation users (Rudis 1987), and U.S. Department of Agriculture, Soil Conservation Service estimates of land use and land cover (Flather and others 1989).

Progress by FIA units in meeting other user needs is discussed in more detail by Born (1990), Brooks (1990a), Cost (1990b), Mead and LaBau (1990), O'Brien (1990), Ohmann (1990), and Rudis (1990a). In general, progress has been made by discussing inventoried characteristics relevant to the perceived needs of selected user groups. Some of the forest area and tree characteristics are repackaged, supplemented with additional data on forest characteristics, and presented in tabular form (DiGiovanni and Scott 1990), examined in multiple-value forest resource assessment reports (Bolsinger 1988, 1989; Castonguay and Hansen 1984, Ohmann and others 1988; Rudis 1988a, 1988b; USDA FS and others 1986), or analyzed in regional level assessments (Flather and others 1990, Joyce and Flather 1990). Other analyses have targeted specialized audiences, with articles in regional conference proceedings, subject-matter journals, and technical research reports.

Additional information—not always published—is made available as specific user needs are defined. Examples include (1) assessment of the extent, distribution, and trends in potentially threatened forest ecosystems, such as forested wetlands, natural forest communities (versus intensively-managed plantations), old-growth stands, and roadless areas; (2) estimates of biomass from noncommercial timber sources; e.g., pinyon-juniper woodlands (Chojnacky 1985); (3) habitat assessments of white-tailed deer and other game; (4) estimation of habitats for sensitive, threatened, and endangered woodland animals, such as the North Central States' Kirtland's warbler, the South's red-cockaded woodpecker, and the pileated woodpecker for Intermountain States; and (5) notes on the presence of native or naturalized plant species (e.g., Pacific yew) of biological or economic importance. A number of these data requests have come from the Nature Conservancy's regional headquarters, the Natural Heritage Program agencies (Nature Conservancy State-level affiliates), and from State botanists and nongame wildlife agencies.

Opportunities for Future Involvement

Few management or planning agencies can afford the cost of timber resource surveys like those conducted by FIA units, let alone satisfy the field data needs for monitoring and basic research in wildlife, recreation, range science, and hydrology at the regional level. Simple examination of FIA data can suggest hypotheses for the geographic distribution of forested ecosystems, associated characteristics and habitats for forest-dwelling species, and trends in

regional ecological landscape dynamics and land-use practices. FIA data also can be used to compare other sampling techniques by providing an independent estimate of forest cover, e.g., rising FIA data in global monitoring models (Iverson and others 1990, Lund 1990, Teuber 1990, Van Hooser and others 1990). Further evaluation and critical assessment at appropriate levels of aggregation are encouraged. For more details, contact the FIA unit that surveys the State or region of interest; a list of these units is provided in the Additional Information section in the appendix.

As other disciplines, agencies, and private institutions in hydrology, soils, range science, botany, ecology, zoology, wildlife planning, and recreation become familiar with forest survey data, there are likely to be more opportunities for interdisciplinary collaboration in data collection and analyses. In the near future, linkage of FIA data with a geographic information system and satellite imagery can further FIA data use by making spatially oriented data retrievals easier—not only for forest resource analysts, but also for decisionmakers and advocacy groups in a variety of disciplines. Integration of past and current FIA data with other land-use data should provide users with an improved information data base with which to test hypotheses and become better informed about regional impacts of agency policies or industry decisions.

Appendix

NOTES ON THE BIBLIOGRAPHY

To assist researchers, planners, and forest managers involved in other disciplines, a bibliographic data base has been prepared. The contents of the data base as of December 31, 1990, are listed in table 1. An index is provided. Citations can be retrieved in other formats.

To ease updating, entries of senior authors with more than one publication in a single year are not distinguished by lowercase letters. Titles beginning with "A", "And", or "The" are not ignored in alphabetizing. Department series publications (e.g., Resource Bulletin) are not abbreviated.

Due to data base software limitations, the order of bibliographic entries follows a modified alphabetical order as follows: space, uppercase letters (A, B, C, ..., Z), punctuations (" ", ".", ",", ";"), lowercase letters (a, b, c, ..., z). Entries are listed first in modified alphabetical order and then chronological order. With the above exceptions, entries follow ANSI standards (American National Standards Institute. 1977. American national standard for bibliographic references. ANSI Z39.29. New York. 92 p.).

The information in any citation can be used to match citations with the same terms. Each citation lists author, year, title, location (i.e., journal, proceedings, United States Government publication number, etc.), and keywords. Keywords augment information in the titles.

Capitalized keywords list the major FIA unit from which the data were drawn. The words *United States* or the standard two-digit State postal codes are listed if the reference covers only a portion of States served by the listed FIA unit. The other keywords list subject matter not mentioned in the title.

The subject matter keyword is one of the following:

- (1) the principal subject matter, e.g., *water* (hydrology), *range* (includes livestock grazing), *wildlife* habitat, or *recreation*;
- (2) *multivalued*, where the principal subject matter encompasses more than one of the above;
- (3) a related topic associated with one of the above.

Related topics are: land *area classification*, *biomass*, *land use*, *owner* surveys, *satellite* image interpretation, *soils*, and *technique*. *Biomass* includes nontraditional wood products such as firewood as well as herbaceous biomass from tree crowns, shrubs, and nonwoody plants. *Design* studies include discussion of the multiple values to be considered in sampling, analysis, and design of inventories. *Owner* surveys include landowner surveys as well as forest land characteristics described by landowner type. *Technique* studies generally involve statistical model development of inventoried forest characteristics to assess a forest attribute,

or field sampling of a forest attribute that is compatible with the existing sample design. Examine the references carefully for more detailed information.

ADDITIONAL INFORMATION

The codes associated with the FIA units, the postal codes for the States that they survey, and whom to contact for further information about forest survey data and analyses are provided:

INTFIA: AZ, CO, ID, MT, NM, NV, UT, WY.

Address: Project Leader, Forest Survey Unit, Intermountain Research Station, Forestry Sciences Laboratory, 507 25th Street, Ogden, UT 84401. Telephone (801) 625-5388

NCFIA: KS, IL, IN, IA, MI, MN, MO, ND, NE, SD, WI.

Address: Project Leader, Forest Inventory and Analysis Unit, North Central Forest Experiment Station, 1992 Folwell Avenue, St. Paul, MN 55108. Telephone (612) 649-5139

NEFIA: CT, DE, KY, MD, ME, MA, NH, NJ, NY, OH, PA, RI, VT, WV.

Address: Project Leader, Forest Inventory and Analysis Unit, Northeastern Forest Experiment Station, 5 Radnor Corporate Center, Suite 200, 100 Matsonford Road, Radnor, PA 19087. Telephone (215) 975-4075

PNWFIA: OR, WA, CA. Also conducts surveys in the Hawaiian Islands and other United States territories in the Pacific Ocean.

Address: Project Leader, Forest Inventory and Analysis Unit, Pacific Northwest Research Station, Forestry Sciences Laboratory, P.O. Box 3890, Portland, OR 97208. Telephone (503) 321-5800

PNWFIA: AK.

Address: Project Leader, Forest Inventory and Analysis Unit, Pacific Northwest Research Station, Forestry Sciences Laboratory, 201 East 9th Avenue, Suite 303, Anchorage, AK 99501. Telephone (907) 271-2585

RM: Not responsible for individual States. Focus is on the analysis of regional resources, national issues, and statistical sampling techniques. Data are obtained in cooperation with a number of Federal and State agencies, in addition to FIA units. There are two units:

- (1) Renewable Resource Ecology and Management Science Research Unit. Telephone (301) 498-1850.

(2) Multiresource Inventory Techniques Unit.
Telephone (303) 498-1294.

Address: Project Leader (of the unit of interest), Rocky Mountain Forest and Range Experiment Station, 240 West Prospect, Fort Collins, CO 80526-2098.

SEFIA: FL, GA, NC, SC, VA.

Address: Project Leader, Forest Inventory and Analysis Unit, Southeastern Forest Experiment Station, 200 Weaver Boulevard, P.O. Box 2680, Asheville, NC 28802. Telephone (704) 257-4350

SOFIA: AL, AR, LA, MS, OK, TN, TX. Also conducts surveys in Puerto Rico and other U.S. territories in the Caribbean Basin.

Address: Project Leader, Forest Inventory and Analysis Unit, Southern Forest Experiment Station, 201 Lincoln Green, P.O. Box 906, Starkville, MS 39759. Telephone (601) 324-1611

WO: Federal coordination for FIA units, under the Director for Research; U.S. Department of Agriculture, Forest Service; Forest Inventory, Economics, and Recreation Research Staff.

Address: Branch Chief, Forest Inventory and Analysis Unit, P.O. Box 96090, Auditors Building, 201 14th Street, SW, Washington, DC 20250. Telephone (202) 382-9343

Rudis, Victor A. 1991. Wildlife habitat, range, recreation, hydrology, and related research using Forest Inventory and Analysis surveys: a 12-year compendium. Gen. Tech. Rep. SO-84. New Orleans, LA: U.S. Department of Agriculture, Forest Service, Southern Forest Experiment Station. 61 p.

More than 400 publications are listed for the period 1979 to 1990; these focus on water, range, wildlife habitat, recreation, and related studies derived from U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis unit surveys conducted on private and public land in the continental United States. Included is an overview of problems and progress in conducting multiple-value forest resource surveys since 1974. Information regarding a bibliographic data base containing these citations is provided.

Keywords: bibliography, forest resources, historical synthesis, interdisciplinary studies, multiresource inventories.
