TIMBER RESOURCE STATISTICS FOR MIDSOUTH COUNTIES, 1971

Roy C. Beltz and Daniel F. Bertelson

Southern forests are changing constantly and rapidly. Though fast-growing, they are subject to heavy cutting for timber and, in some parts, to extensive clearing. Growth and change in industries drawing upon the forests are also rapid. To gage these changes and their effect upon the resource, the Forest Resources Research Unit of the Southern Forest Experiment Station makes on-the-ground surveys at 10-year intervals. The surveys are conducted continuously, one State after another. Hence the information for each State is from a different year; the dates of the most recent surveys are as follows:

Alabama	1963
Arkansas	1969
Louisiana	1964
Mississippi	1967
Oklahoma	1966
Tennessee	1971
Texas	1965

The resource statistics provided by the surveys are the basis for many decisions about the management of both public and private forest land. Because of the interval between surveys, decisions have often been made with information that was neither current nor detailed enough for local needs. To remedy this shortcoming, Forest Resources Research has developed a computerized system for annually updating the basic field data. In this report the method has been applied to produce current resource and production statistics for counties of six States. It is the first such report to become available for the Midsouth—or for any other forest region of comparable size.

In general, Midsouth forest inventories have been trending upward for some time. State or regional totals, however, often mask localized

situations in which timber is becoming exceptionally abundant or where the harvest is making inroads upon the growing stock. Current, county-level information enables resource managers to identify such situations in early stages of development.

The basic procedure for updating field survey data was developed and programmed for Mississippi.¹ Now it has not only been expanded to other States but has also been constrained to conform with results of the TRAS program² used by the USDA Forest Service to make appraisals on the national and State levels. Hence the present data agree with national statistics and yet provide information for individual counties.

Fundamentally, the procedure is one of updating resource statistics by applying current information about rate of use. The beginning point is always the inventory and growth rates determined by the field surveys, but the information about current change varies by States. Severance tax data provide trend information in Mississippi, Louisiana, Arkansas, and Alabama. The Texas Forest Service makes a yearly census of lumber production. The annual pulpwood production estimates compiled by Forest Resources Research are also valuable sources.

Product output, timber removals, and growth are shown for calendar year 1970. The resultant inventory is estimated as of January 1, 1971. The information for Tennessee is a reproduction of results from the 1971 survey. Alabama has been omitted, as data from a new field survey will be available in 1972.

² Larson, R. W., and Goforth, M. H. TRAS—a computer program for the projection of timber volume. USDA Agric. Handb. 377, 24 p. 1970.

¹ Beltz, R. C., and Christopher, J. F. Computer program for updating timber resource statistics by county, with tables for Mississippi. USDA Forest Serv. Resour. Bull. SO-23, 22 p. South. Forest Exp. Stn., New Orleans, La. 1970.

In the tables of product output, zeros may indicate either no production or lack of information to update survey data. Updated product output is the basis for estimating timber cut; when current product information was lacking the survey data for timber cut were either held constant or adjusted in the light of previous trends. Adjustments were made for removals occasioned by harvest for minor products, by timber stand improvement, and by land clearing in the Louisiana Delta. Allowances were also made for the effects of Hurricane Camille in the southern counties of Mississippi.

Users of the updated statistics should be cog-

nizant of some inherent limitations. The precision of the estimates hinges not only about the accuracy of the field survey but also upon the data available to indicate change. While there is substantial information about product output for most States, only pulpwood data are available for Oklahoma and Tennessee. Perhaps in the interim between this and succeeding estimates additional information will become available in these States.

Even at the time of field survey, county estimates are subject to high sampling errors. Combining county estimates into groups of at least five markedly improves reliability.

Table 1. Arkansas: Timber products output by county, 1970

County	Saw logs		Posts	Poles and piling	Other		Pulpwood		All products total
	Softwood	Hardwood			Softwood	Hardwood	Softwood	Hardwood
