Research Work Unit

# FOREST STATISTICS FOR WEST TENNESSEE COUNTIES

Staff: Renewable Resources Evaluation Research Work Unit

These tables were derived from data obtained during a 1980 inventory of 18 counties comprising the West Unit of Tennessee (fig. 1). The data on forest acreage and timber volume were secured by a systematic sampling method involving a forest-nonforest classification on aerial photographs and on-the-ground measurements of trees at sample locations. The sample locations were at the intersections of a grid of lines spaced 3 miles apart. At each forest location, 10 BA 37.5 point samples were distributed on an area of about 1 acre.

The sampling methods were developed to provide suitable State estimates. Estimates for smaller areas are presented, but sampling error increases as the area considered decreases. Sampling errors given in table 1 are based on one standard deviation or a probability of two chances out of three. To estimate the sampling error for a combination of counties one can use the following:

$$SE_G = \frac{SE_T \sqrt{X_T}}{\sqrt{X_G}}$$

where:

- SE = Sampling error
- X = variable of interest (area, volume)
- G = group of counties to be combined
- T = total for the unit

Sampling errors for estimates of the principal timber species are shown in table 2.

Because of differences in standards of tree measurements, direct comparisons between these data and those from

1971 inventory are not valid. In table 3, changes between the two surveys are summarized in terms of current measurement standards.

Table 1.--Sampling errors<sup>1</sup> for forest land and timber volume, 1980

| County            | Commercial forest land | Growing stock | Sawtimber |
|-------------------|------------------------|---------------|-----------|
| -----Percent----- |                        |               |           |
| Carroll           | 2                      | 10            | 23        |
| Chester           | 4                      | 19            | 27        |
| Crockett          | 4                      | -             | -         |
| Dyer              | 3                      | 12            | 19        |
| Fayette           | 2                      | 18            | 23        |
| Gibson            | 3                      | 32            | 32        |
| Hardeman          | 2                      | 12            | 17        |
| Haywood           | 3                      | 13            | 18        |
| Henderson         | 3                      | 11            | 16        |
| Henry             | 2                      | 13            | 19        |
| Lake              | 2                      | 43            | 46        |

<sup>1</sup>/ By random-sampling formula.

## DEFINITIONS OF TERMS

Acceptable trees.--Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

Commercial forest land.--Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization.

Desirable trees.--Growing-stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

Forest type.--A classification of forest land based upon the species forming a plurality of live-tree stocking.

Figure 1. --The West forest survey region of Tennessee.

Table 2.--Sampling errors for timber volume by species, 1980

| Species           | Growing stock | Sawtimber |
|-------------------|---------------|-----------|
| -----Percent----- |               |           |
| Softwood:         |               |           |
| Shortleaf pine    | 24            | 28        |
| Loblolly pine     | 32            | 38        |

| All species       | 4.3           | 6.2       |

1/ Exceeds 50 percent.

Table 3.--Change<sup>1</sup> in forest resource since, 1971

| Item                   | Change  |
|------------------------|---------|
|                        | Percent |
| Commercial forest land | + 20    |
| Growing-stock volume:  |         |
| Softwood               | + 81    |
| Hardwood               | + 38    |
| All species            | + 42    |
| Sawtimber volume:      |         |
| Softwood               | + 116   |
| Hardwood               | + 45    |
| All species            | + 52    |

1/ Based on current measurement standards.

Growing-stock trees.--Live trees that are of commercial species and qualify as desirable or acceptable trees.

Growing-stock volume.--Net volume in cubic feet of growing-stock trees at least 5.0 inches in diameter at breast height, from a 1 foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

Noncommercial species.--Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Physiographic site.--A classification of forest land according to its suitability for growing certain species groups--pine, upland hardwood, or bottomland hardwood.

Poletimber trees.--Growing-stock trees of commercial species at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

Rotten trees.--Live trees of commercial species that do not contain at

least one 12-foot saw log, now or prospectively, primarily because of rot.

Rough trees.--Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of roughness or poor form. (Includes all live trees of noncommercial species.)

Sawtimber trees.--Live trees that are of commercial species, contain at least a 12-foot saw log, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

Sawtimber volume.--Net volume of the sawlog portion of live sawtimber in board feet, International 1/4-inch rule.

Site class.--A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

Stand-size class.--A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber, or sapling and seedling.

Table 4.--Total area, commercial forest land, and proportion of total area, 1980

| County                | Total <sup>1</sup><br>area | Commercial forest |            |
|-----------------------|----------------------------|-------------------|------------|
|                       |                            | Area              | Proportion |
| <i>Thousand acres</i> |                            |                   |            |
| <i>Percent</i>        |                            |                   |            |
