SOUTHERN PULPWOOD PRODUCTION, 1971

Thomas R. Bellamy

Associate Mensurationist

SOUTHERN PULPWOOD PRODUCTION IN 1971 totaled 41,913,816 cords—67 percent of the Nation's total. The region's production was down slightly (about 1 percent from the previous year) for the first time in 13 years. During the year, two new mills began production and 20 others increased their capacities. These expansions boosted daily pulping capacity in the region by 5 percent, to 87,496 tons. At the end of the year there were 109 pulpmills in the region, with three more under construction.

Pulpwood production in the South totaled 41.9 million cords in 1971, but was down slightly from the previous year for the first time in 13 years. Several factors contributed to the decline, including a softening in the market and a reduction in the inventories at woodyards.

Production was up in only five of the 12 states, all in the Midsouth (table 1). In cords produced, the largest increases occurred in Arkansas and Texas, and the largest declines were in North Carolina and Mississippi. Production in Georgia, the leading state, totaled almost 7.3 million cords, about the same as for 1970.

Roundwood production totaled almost 31.8 million cords, down by 5 percent from 1970. By species group, the only increase was in the production from gums—from 2.4 to 2.7 million cords. Softwood species, primarily southern yellow pines, continued to provide more than three-fourths of the total roundwood produced (table 2). Total roundwood production was up in four states: Arkansas, Louisiana, Tennessee, and Texas (table 3).

An 18-percent increase in the use of wood residues for pulpwood tended to offset the decline in roundwood production. Output of wood residues for pulp manufacture amounted to the equivalent of 10.1 million cords, or 24 percent of

Figure 1. Pulpwood production in the South, by source and percent of total production, 1970-1971.

total production (fig. 1). Almost 81 percent of these residues were from softwood species, compared to 76 percent in 1970. This change probably reflects increased production of softwood lumber and plywood. Total output from wood residues was up by more than 30 percent in Arkansas, Georgia, and Oklahoma (table 4), and more than 90 percent of the residue volume was in the form of chips (table 5).

In 1969, total pulpwood production in the Midsouth surpassed that in the Southeast for the first time in at least 30 years. This shift in production patterns continued, and in 1971 production in the Midsouth exceeded that in the Southeast by more than 2.3 million cords. The Southeast led only in the production of softwood roundwood (table 6).

Production of roundwood in 1971 exceeded 100,000 cords in 69 counties or parishes, and 48 of these are located in the Midsouth (tables 7-18). Baldwin and Choctaw Counties in Alabama, Beaufort County in North Carolina, and Vernon Parish in Louisiana were the leaders with almost 884,000 cords produced.

Two new mills began operation during 1971, and 20 others increased their capacities. As a result of these expansions, daily pulping capacity at the 109 mills in the South increased to 87,496 tons, or by 5 percent (table 19). At the end of the year, there were three new mills under construction (table 20). In 1971, 14 mills located outside the region also drew wood from the South.

Table 1.--Pulpwood production in the South during 1971, and change since 1970

Bellamy, Thomas R.

1972. Southern pulpwood production, 1971. Southeast.
For. Exp. Stn., USDA For. Serv. Resour. Bull.
SE-23, 20 pp.

In 1971, pulpwood production in the South totaled 41,913,816 cords--67 percent of the Nation's total. The region's production was down slightly (about 1 percent from the previous year) for the first time in 13 years. During the year, two new mills began production and 20 others increased their capacities. These expansions boosted daily pulping capacity in the region by 5 percent, to 87,496 tons. At the end of the year there were 109 pulpmills in the region, with three more under construction.
