FOREST STATISTICS FOR ALABAMA COUNTIES IN 1982

Staff: Forest Inventory and Analysis Research Work Unit

These tables were derived from data obtained during a 1982 inventory of Alabama. The data on forest acreage and timber volume were secured by a systematic sampling method involving a forest-nonforest classification on aerial photographs and on-the-ground measurements of trees at sample locations. The sample locations were at the intersections of a grid of lines spaced 3 miles apart. At each forest location, per acre estimates were obtained from 5 BA 37.5 point samples.

The sampling methods were developed to provide suitable State estimates. Estimates for smaller areas are presented, but sampling error increases as the area considered decreases. Sampling errors given in table 1 are based on one standard deviation or a probability of two chances out of three. To estimate the sampling error for a combination of counties one can use the following:

$$SE_G = \frac{SET \sqrt{X_T}}{\sqrt{X_G}}$$

where:

- SE = standard error of estimate (%)
- X = variable of interest (area, volume)
- G = group of counties to be combined
- T = total for the state

Sampling errors for estimates of the principal timber species are shown in table 2.

DEFINITIONS OF TERMS

Acceptable trees--Growing-stock trees of **commercial** species that meet specified standards of size and quality

but do not qualify as desirable trees.

Commercial forest land--Forest land producing or **capable of** producing crops of industrial wood and not withdrawn from timber utilization.

Desirable trees--Growing-stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

Forest type--A classification of forest land based upon the species forming a plurality of live-tree stocking.

Growing-stock trees--Live trees that are of commercial species and qualify as desirable or acceptable trees.

Growing-stock volume--Net volume in cubic feet of growing-stock trees at least 5.0 inches in-diameter at breast height, from a 1 foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

Mortality--Sound-wood volume of live trees dying from natural causes during a specified period.

Net periodic annual growth--Average annual net volume increase for the inter-survey period.

Noncommercial species--Tree species of **typically** small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood **products**.

Physiographic site--A classification of forest land according to its suitability for growing certain species **groups**--pine, upland hardwood, or bottomland hardwood.

Poletimber trees--Growing-stock trees of **commercial species** at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

Rotten trees--Live trees of **commercial** species that do not contain at least one 12-foot saw log, now or prospectively, because of **rot**.

Forest Resource Regions of *Alabama*.

Rough trees--Live trees of commercial species that do not contain at least one **12-foot** saw log, now or **prospectively**, primarily because of roughness or poor form. (Includes all live trees of noncommercial species.)

Sawtimber trees--Live trees that are of commercial species, contain at least a **12-foot saw log**, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

Sawtimber volume--Net volume of the saw log portion of live sawtimber in

board feet, International 1/4-inch rule, and in cubic feet.

Site class--A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

Stand-size class--A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber, or sapling and seedling.

Timber removals--The net volume of growing-stock trees removed from the inventory by harvesting, cultural operations such as timber-stand improvement, land clearing, or changes in land use.

¹Totals may not add due to rounding.

²Negative net annual growth is the result of annual mortality and cull increment exceeding periodic annual (gross) growth. Cull increment is the volume of growing stock that became rough or rotten.
