SAWTIMBER IN —		
— International ¼-inch rule		11, 12, 15, 16, 19, 20, 32, 33, 34
NET ANNUAL GROWTH		25, 26, 35
TIMBER REMOVALS		27, 28
MORTALITY		29

ACKNOWLEDGEMENT

Generous assistance from public and private organizations made it possible to keep the field work for the latest forest inventory of Arkansas ahead of the schedule that could have been maintained with regularly allotted funds. The very material aid of the organizations listed below, and of the individuals in them, is gratefully acknowledged:

ARKANSAS FORESTRY COMMISSION
 CHICAGO MILL AND LUMBER COMPANY, INC.
 DELTIC FARM AND TIMBER COMPANY
 GEORGIA-PACIFIC CORPORATION
 INTERNATIONAL PAPER COMPANY
 NEKOOSA-EDWARDS PAPER COMPANY, INC.
 POTLATCH FORESTS, INC.
 WEYERHAEUSER COMPANY

Forest Statistics for Arkansas Counties

Staff:
Renewable Resources
Evaluation Research
Work Unit

This report tabulates information from a new forest survey of Arkansas completed in 1979 by the Renewable Resources Evaluation Research Unit of the Southern Forest Experiment Station. Forest area was estimated from aerial photos with an adjustment for ground truth at selected locations. Sample plots were systematically established at three-mile intervals using a grid oriented roughly N-S and E-W. At each location, prism sample points were distributed over approximately 1 acre. Volume estimates were based on measurement of trees selected at these sample points.

The sampling methods were developed to provide suitable State estimates.

The sampling errors to which the State area and volume totals are liable (on a probability of two chances out of three) are indicated in table 1.

Detailed sampling errors are shown in tables 39 through 43.

Estimates for smaller- areas are presented but sampling error increases as the area considered declines.

To estimate the sampling error for a combination of counties one can use the following:

$$SEG = \frac{SE_T \sqrt{X_T}}{\sqrt{X_G}}$$

where:

SE = Sampling error

X = variable of interest (area, volume)

G = group of counties to be combined

T = total for the state

Because of differences in standards of tree measurements, direct comparisons between these data and the 1969 inventory are invalid. In table 2, changes between the two surveys are summarized in terms of current measurement standards.

Table 1.--Sampling errors for *forest land* and *volume estimates*

<i>Item</i>	<i>Sampling error</i>
<i>- - Percent - -</i>	
<i>Commercial forest land</i>	.3
<i>Growing-stock volume</i>	1.3
<i>Sawtimber volume</i> ¹	1.8
<i>Growth on growing stock</i>	1.3
<i>Growth on sawtimber</i>	2.0
<i>Removals from growing stock</i>	1.9
<i>Removals from sawtimber</i>	2.3

¹International ½-inch **rule**.

DEFINITIONS OF TERMS

Acceptable trees. — Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

Commercial forest land. — Forest land producing or capable of producing crops of industrial

Table 2.--Commercial forest mea, growing-stock, and sawtimber volume, 1978, and change since 1969

Resource region	Commercial forest		Growing Stock				Sawtimber

¹Based on current measurement standards.

²Negligible

wood and not withdrawn from timber utilization.

Desirable trees. — Growing-stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

Forest type. — A classification of forest land based upon the species forming a plurality of live-tree stocking.

Growing-stock trees. — Live trees that are of commercial species and qualify as desirable or acceptable trees.

Growing-stock volume. — Net volume in cubic feet of growing-stock trees at least 5.0 inches in diameter at breast height, from a 1-foot stump to a minimum of 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

Mortality. — Sound-wood volume of live trees dying from natural causes during a specified period.

Net annual growth. — The increase in volume of a specified size class for a specific year.

Noncommercial species — Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Physiographic site. — A classification of forest land according to its suitability for growing certain species groups — pines, upland hardwoods, or bottom land hardwoods.

Poletimber trees — Growing-stock trees of com-

mmercial species at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

Rotten trees. — Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of rot.

Rough trees. — Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of roughness or poor form. (Includes all live trees of non-commercial species.)

Sawtimber trees. — Live trees that are of commercial species, contain at least a 12-foot saw log, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

Sawtimber volume. — Net volume of the saw-log portion of live sawtimber in board feet, International 1/4-inch rule.

Site class. — A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

Stand-size class. — A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber, or seedlings and saplings.

Timber removals. — The net volume of growing-stock trees removed from the inventory by harvesting, cultural operations such as timber-stand improvement, land clearing, or changes in land use.
