SOUTHEASTERN FOREST EXPERIMENT STATION
Asheville, North Carolina

of the

Forest Service, U. S. Department of Agriculture

in cooperation with

SOUTHERN PULPWOOD CONSERVATION ASSOCIATION
Atlanta, Georgia

1967

The South's booming pulpwood industry again had a record-breaking year in 1966, when a total of 33.1 million cords of wood were produced. This amount, nearly 61 percent of the Nation's total, went to 87 mills in the 12 Southern States and 10 mills outside of the South. Expansion of existing facilities plus the addition of 5 new mills during the year increased the South's pulping capacity to 64.7 thousand tons per day—a gain of more than 9 percent.

Pulpwood production in the South rose 7 percent in 1966, to 33,061,243 cords. This is the highest output on record and the ninth consecutive increase in annual production. Pine roundwood accounted for 57 percent of the increase, and residues or byproducts from other wood-using industries, 26 percent. The remainder was due to an increase in the harvest of hardwood bolts.

Gains in pulpwood production were reported in 10 of the 12 Southern States (table 1). Mississippi had the largest increase—686,000 cords. Alabama produced nearly 430,000 cords more in 1966 than in 1965. In view of current construction, it is almost certain that output in the two States will continue to increase rapidly. In Mississippi, two mills with a combined capacity of more than 2,500 tons per day are under construction. Alabama also has two mills going up, which will increase the State's daily pulping capacity by 1,450 tons. In addi-

tion, two new mills started up in Alabama in late 1966.

Louisiana, South Carolina, and Texas all increased their outputs by more than 200,000 cords in 1966. Of the remaining Southern States, all but Oklahoma, Virginia, and Tennessee produced 100,000 cords more in 1966 than in 1965. Production declined 2 percent in Virginia and 11 percent in Tennessee.

A total of 43 counties produced 100,000 cords or more in 1966, as compared to 37 in 1965. Union Parish, Louisiana, was the leader for the third consecutive year with 213,149 cords. Fairfield County, South Carolina, was second with 204,635 cords, and Choctaw County, Alabama, was third with a total output of 201,629 cords.

Of the 27.3 million cords of roundwood harvested in 1966, 20.8 million were pine and 6.5 million were hardwood. Oaks accounted for

Table 1. Pulpwood production in the South during 1966 and change since 1965

All States	27,299.7	20,777.8	6,521.9	2,251.6	2,538.4	1,731.9

39 percent of the hardwood bolts, gums 35 percent, and other hardwoods 26 percent. This was the first year in which the output of oaks exceeded that of gums. Figure 1 shows the changes in production by hardwood species group since 1963. If present trends continue, annual consumption of the gums will soon fall below that of both oaks and other hardwoods. Improved technology, which has facilitated the processing of oaks and other hardwoods, has contributed to the increased consumption of these species.

Figure 1. Round pulpwood production of gums, oaks, and other hardwoods in the South, 1963-1966.

About 5.8 million cord equivalents of residues were consumed by the pulping industry in 1966. This was an increase of more than 11 percent over 1965. The bulk of the residues—some 80 percent—were pine chips made primarily from sawmill slabs and edgings.

The proportion of wood that arrives at the mills as chips will increase markedly in future years. One reason is that utilization of residues is expected to rise, but the main reason is that the number of roundwood chipping plants is growing rapidly. Rough roundwood delivered to these plants is converted into chips which are loaded on railroad cars or trucks for ship-

ment to a pulpmill. In 1964, there were or 5 such installations in the entire South; by the end of 1966 there were 13 either in operation or in various stages of construction in Mississippi alone.

Pulp company officials were asked to report chipped residues separately from chipped roundwood. The reported volume of chipped roundwood is included in the roundwood table of this paper. With use of chips rising rapidly, continued accurate and complete differentiation between chipped residues and chipped roundwood will be needed in future years. Roundwood procurement summaries by State and county are to be kept meaningful.

In 1966, five new pulpmills went into operation. They, along with expanded existing facilities, boosted the total daily pulping capacity in the South by nearly 5,500 tons. Georgia, the long-time leader in production capacity, led the South again with a total capability of more than 12,000 tons per day. Florida was second with a combined daily potential of 8,773 tons and Alabama was third with 7,893 tons.

At the close of 1966, eleven new pulpmills were being erected in the South and several others were announced. Alabama, Louisiana, Mississippi, and Texas each had two mills under construction, while Arkansas, Georgia, and South Carolina had one. When these mills begin operating, they will increase the daily pulping capacity in the South by 7,835 tons—a 12-percent boost over the 1966 potential. Figure 2 shows what impact the new mills will have on the capacity in each State. The opening of these mills will assure a continued increase in demand for southern pulpwood.

Figure 2. Daily pulping capacity by State, 1966 and increase anticipated from addition of mills under construction.

Each dot represents an average of 10,000 cords of pine.

Each dot represents an average of 5,000 cords of hardwood.
