Forest Service, U. S. Department of Agriculture

1974

This report tabulates information from a new forest inventory of parishes in south-eastern Louisiana. The tables are intended for use as source data in compiling estimates for groups of parishes. Because the sampling procedure is designed primarily to furnish inventory data for the State as a whole, estimates for individual parishes have limited and variable accuracy.

The data on forest acreage and timber volume were secured by a systematic sampling method involving a forest-nonforest classification on aerial photographs and on-the-ground measurements of trees at sample locations. The sample locations were at the intersections of a grid of lines spaced 3 miles apart. At each forested location, 10 small plots were uniformly distributed on an area of about 1 acre.

The sampling errors to which the parish area and volume totals are liable (on a probability of two chances out of three) are shown in table 1.

Table 1. *Sampling errors¹ for forest land and timber volume, 1974*

Parish	Commercial forest land	Growing stock	Saw-timber
- - - Percent - - -			
East Baton Rouge	3	13	18
East Feliciana	3	13	17
Livingston	3	11	14
St. Helena	3	14	20
St. Tammany	2	9	12
Tangipahoa	2	11	16
Washington	2	14	18
All parishes	1.0	4.6	6.1

¹ By random-sampling formula.

An approximation of sampling errors for groups of parishes may be obtained by using the formula:

$$e = \frac{(SE) \sqrt{\text{specified volume or area}}}{\sqrt{\text{volume or area total in question}}}$$

Where: e = Estimated sampling error of the volume or area total in question

SE = Specified sampling error for the State.

The error decreases when data for two or more parishes are grouped. Conversely, as data for individual parishes are broken down by various subdivisions, the possibility of error increases and is greatest for the smallest items. Sampling errors associated with the estimates of the principal timber species in this report are shown in table 2.

Table 2. *Sampling errors for timber volume by species, 1974*

Species	Growing stock	Sawtimber
- Percent -		
Softwood:		
Longleaf pine	26	27
Slash pine	20	26
Shortleaf pine	24	28
Loblolly pine	10	11
Spruce pine	22	22
Cypress	22	24
All softwoods	5.9	7.3
Hardwood:		
Select white oaks	25	31
Select red oaks	22	27
Other white oaks	18	23
Other red oaks	11	12
Hickory	48	(¹)

White ash	42	(¹)
Other ashes	34	44
Yellow-poplar	23	28
Magnolia	32	30
Sweetbay	28	39
Willow	44	(¹)
American elm	30	41
Other elms	33	(¹)
Dogwood	40	(¹)
Holly	46	(¹)
Other commercial	(¹)	(¹)
All hardwoods	7.4	11.2
All species	4.6	6.1

¹ Exceeds 50 percent.

Because of differences in standards of tree measurement, direct comparisons cannot be made between the estimates in this report and those from the survey of 1964. In table 3, changes between the two surveys are sum-

marized in terms of current measurement standards.

Table 3. *Change¹ in forest resource since 1964*

Item	Change
	Percent
Commercial forest land	— 5
Growing-stock volume:	
Softwood	+ 10
Hardwood	— 6
All species	+ 3
Sawtimber volume:	
Softwood	+ 9
Hardwood	— 8
All species	+ 4

¹ Based on current measurement standards.

Data for other parishes of Louisiana will be published as field work progresses. A State-wide interpretive report will be issued when all parishes have been inventoried; it will include an evaluation of timber trends since 1964.

DEFINITIONS OF TERMS

Acceptable trees.—Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

Commercial forest land.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization.

Desirable trees.—Growing-stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

Forest type.—A classification of forest land based upon the species forming a plurality of live-tree stocking.

Growing-stock trees.—Live trees that are of commercial species and qualify as desirable or acceptable trees.

Growing-stock volume.—Net volume in cubic feet of growing-stock trees at least 5.0 inches in diameter at breast height, from a 1-foot stump to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

Noncommercial species.—Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

Physiographic site.—A classification of forest land according to its suitability for growing certain species groups—pine, upland hardwood, or bottom-land hardwood.

Poletimber trees.—Growing-stock trees of commercial species at least 5.0 inches in diameter at breast height, but smaller than sawtimber size.

Rotten trees.—Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of rot.

Rough trees.—Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of roughness or poor form. (Includes all live trees of non-commercial species.)

Sawtimber trees.—Live trees that are of commercial species, contain at least a 12-foot saw log, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

Sawtimber volume.—Net volume of the saw-log portion of live sawtimber in board feet, International ¼-inch rule.

Site class.—A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

Stand-size class.—A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber, or sapling and seedling.
