Geographic Range

This BpS is found in arctic AK on the Yukon-Kuskokwim Delta and the Kotzebue Sound lowlands ecoregions (Nowacki et al. 2001) but not on the Beaufort Coastal Plain.

Biophysical Site Description

This system occurs on flat permafrost plateaus and gently sloping terrain (Talbot et al. 1985, Jorgenson et al. 1997, Boggs et al. 2008). Soils are poorly drained and acidic, typically with a well-developed peat layer (Boggs et al. 2008). Permafrost is present.

Vegetation Description

Dwarf and low-shrub cover is >25% and lichen cover is >25%. Fruticose lichen species (e.g. Cladina and Cladonia spp.) codominate with Betula nana and Ledum palustre ssp. decumbens. Other possible shrubs include Empetrum nigrum, Chamaedaphne calyculata, Vaccinium uliginosum, Salix pulchra, Spiraea stevenii, Vaccinium vitis-idaea and Arctostaphylos spp. Graminoids usually have <10% cover and may include Eriophorum spp., Carex aquatilis and Carex microchaeta.

Disturbance Description

This system generally occurs as a late-seral stage created by permafrost uplift within the thaw pond cycle (described below) but it occasionally occurs outside of this cycle (Boggs et al. 2008). Experts at the Arctic Modeling Meeting (April 08) recommended modeling this type independent from the thaw pond cycle because of the long duration of the seral stages within the cycle and because it can occur outside of that cycle.

The following information was taken from the draft Arctic Ecological Systems description with minor

*Dominant Species are from the NRCS PLANTS database. To check a species code, please visit <http://plants.usda.gov>.

**Fire Regime Groups are: I: 0-35 year frequency, surface severity; II: 0-35 year frequency, replacement severity; III: 35-100-year frequency, mixed severity; IV: 35-100+ year frequency, replacement severity; V: 200+ year frequency, replacement severity

modifications (Boggs et al. 2008):

This is a late-seral stage in the thaw pond cycle which starts with the collapse of a permafrost plateau resulting in a wet depression often with open water. This is colonized by marsh species or Sphagnum species or a combination of both. Sedges eventually invade, and the wet sedge-Sphagnum system develops. If organic matter buildup or permafrost uplift the surface, then this system may be seral to the dwarf-shrub-Sphagnum system. This system, in turn, may be seral to the permafrost plateau-dwarf-shrub-lichen system. The seral sequence may not be unidirectional, and the timeframe is unclear, possibly taking hundreds of years.

All Fires					

Fire Intervals (FI):

Fire interval is expressed in years for each fire severity class and for all types of fire combined (All Fires). Average FI is central tendency modeled. Minimum and maximum show the relative range of fire intervals, if known. Probability is the inverse of fire interval in years and is used in reference condition modeling. Percent of all fires is the percent of all fires in that severity class.
